

**SOUTH DAKOTA STATE PLAN
FOR
ARCHAEOLOGICAL RESOURCES**

INTRODUCTION AND OVERVIEW
TO
HISTORIC CONTEXTS AND ARCHAEOLOGICAL MANAGEMENT
REGIONS FOR RESEARCH AND PLANNING:
A WORKING DRAFT

Prepared for

South Dakota Archaeological Research Center
P.O. Box 5005
Rapid City, South Dakota 57709-5005
Contract No. 89C-349

State Historic Preservation Office
Cultural Heritage Center
900 Governors Drive
Pierre, SD 57501-2217

by

R. Peter Winham and L. Adrien Hannus
Archeology Laboratory, Augustana College
Sioux Falls, SD 57105

This publication has been funded with federal funds from the National Park Service, Department of the Interior. However, the contents and opinions do not necessarily reflect the views or policies of the Department of the Interior.

1990 [Partially revised April 1991]

OUTLINE OF 1990-1991 REVISIONS

The sections of the South Dakota State Plan for Archaeological Resources listed below have been updated or changed under this revision.

SECTION 2 INTRODUCTION

Sections have been added on the purpose of the plan, the philosophy behind the plan, policies, preservation goals and topics, and general strengths and weaknesses relating to these statewide goals.

SECTION 3 INTRODUCTION TO THE SOUTH DAKOTA STATE PLAN FOR ARCHAEOLOGICAL RESOURCES

The section relating to Contexts has been moved to Section 2.

SECTION 8 HISTORIC CONTEXTS - THE CONCEPTUAL FRAMEWORK

This section has been slightly revised to include a discussion of changes to Section 10-Contexts (below).

SECTION 9 STATEWIDE RESEARCH TOPICS

Additions/changes to topics have been incorporated on the basis of review comments received.

SECTION 10 CONTEXTS

All contexts have been revised to include lists of sites relating to each context. Distribution maps have been revised to show only regions with known sites (if no known sites are listed the maps show regions with a high potential for sites relating to the context). All categories for which no information is currently provided have been deleted. Some references have been added. Contexts are now numbered consecutively in Section 10, pp. 10-1 through 10-69. Page numbers 11-1 through 22-7 have been deleted.

BIBLIOGRAPHY

A list of additional references submitted by other researchers has been provided, along with those references added to the Contexts section.

MISCELLANEOUS

A table listing the number of sites recorded in each Archaeological Region and a graph displaying this information are also provided. A table cross-referencing Archaeological Regions (1-24) with counties has been included.

SECTION 1 - BACKGROUND

This document constitutes the first major revision of the Management Plan for Archaeological Resources in South Dakota. The management planning process began early in the 1980s with funding from the State Historical Preservation Center to initiate what was then called the Resource Protection Planning Process (RP3). The National Park Service initiated the RP3 process for the following purpose:

to develop a comprehensive historic resource management process which identifies and organizes information about a State's historic, archeological, architectural, and cultural resources into a form and process readily useable for producing high reliability decisions, recommendations, and/or advice about the identification, evaluation, and protection of these resources [U.S. Department of the Interior 1980:1].

The University of South Dakota Archaeology Laboratory, under the direction of Larry Zimmerman, prepared some draft statements and outlines for the RP3. A statement from a Resource Protection Planning Process draft manuscript produced at that time reads:

To develop the study units for South Dakota archaeology, we chose to avoid the current Willey and Phillips' system as it is in use on the Plains. We did, however, hope to integrate the temporal, spatial and formal characteristics into our study unit system. The authors, in lengthy discussions with Robert Alex and James Haug, developed a system that employed geographical distribution and time as the fundamental units of the study unit system. The system is really quite simple and straight forward. First of all, the state was divided into 19 drainage units. Each of these units, in turn, was divided into segments, depending on the size of that drainage unit within the state....Generally speaking, each drainage is divided into two or three sub-units which provide the spatial foundation of the study unit....Each study unit has a temporal dimension as well. Fifteen temporal units were chosen, beginning at 12000 years ago....The 33 geographical units, when combined with the 15 temporal units, yield 495 study units [Anonymous n.d.:3-4; emphasis in original].

The first actual draft management plan document was produced by Jeff Buechler in 1984. The framework for that document was discussed at a working retreat sponsored by the State Archaeological Research Center at the Hardy Campus of Black Hills State College on August 23-26, 1984. Eight participants representing federal, state and private organizations were involved. These individuals and their respective organizations were: Robert Alex, Tom Haberman, and Jim Haug - SARC; Tim Nowak - Omaha District, USACE; Lance Rom - Black Hills National Forest; Peter Miller - State Historical Preservation Center; Peter Winham - ALAC; and Jeff Buechler - Dakota Research Services.

The Hardy Campus meeting was called, in effect, to provide a "quick fix" to the problems the state had had in developing its comprehensive historic resource management plan; namely, that the allotted resources had been spent and no document had been produced! Although many differences of opinion were expressed at the Hardy Campus retreat, the participants recognized the need to get the job done. In this regard, the late Bob Alex was particularly instrumental in pushing the meeting forward and arriving at a workable compromise that enabled Jeff Buechler to produce the draft document (Buechler 1984a).

The two main topics of discussion at the meeting centered on what were then termed "archaeological study units" (actually geographical regions) and the format in which the cultural resources should be discussed within each study unit (region).

The outcome was that the state of South Dakota was divided into 24 study units (regions). These geographical areas are defined in a variety of ways. In general, the areas conform to drainage basins, or specific landforms; however, in several instances political boundaries (counties) are used as a matter of convenience. Definition of the study units (regions) according to drainage basins offers the added advantage of corresponding to management units of federal agencies such as the USACE or Soil Conservation Service.

Within each study unit (region) the cultural resources were then discussed in terms of chronological parameters based on temporal/cultural dimensions. Seven temporal units were chosen to organize the archaeological resources; pre-5000 B.C./Paleoindian; 5000-3500 B.C./Early Archaic; 3500-1500 B.C./Middle Archaic; 1500 B.C.-A.D. 900/Late Archaic-Woodland; A.D. 900-1700/Late Prehistoric/Plains Village; A.D. 1700-1861/Protohistoric; and A.D. 1861-/Historic. The rationale used to arrive at this format was that South Dakota is positioned at the interface of several taxonomic systems. It was felt

that by considering temporal dimensions over cultural definitions the incongruities of the various taxonomic systems could be abated.

Following completion of the draft report (Buechler 1984a), 17 copies were sent to various agencies and interested individuals for comment. By February, 1986 approximately 9-11 sets of comments had been received. These comments were voluntarily summarized by Nick Chevance (1986a) at the request of the Council of South Dakota Archaeologists (CSDA). Many of the comments provided additional information or suggested minor changes to the document, but a few expressed major reservations with the rationale for making the basic decisions on how the study units were formed, noting that unit boundaries were not logically consistent from area to area. One person noted that the divisions made good management units but failed as study units. One respondent strongly objected to the strict use of time units to separate resources, suggesting cultural or archaeological periods conform better to accepted reality.

Other specific comments included requesting more attention to human remains, more detail concerning protohistoric and historic archaeological resources, and more attention to geomorphology and environmental reconstruction.

The next stage in the Management Plan process occurred at Placerville Camp in the Black Hills when the Council of South Dakota Archaeologists held a working meeting from May 16-18, 1986. In attendance at this meeting were Bob Alex, Jeff Buechler, Nick and Therese Chevance, Darrell Fulmer, Tom Haberman, Adrien Hannus, Jim Haug, Tim Nowak, Lance Rom and Peter Winham. The broad-based discussion touched on such topics as: defining the terminology used; defining cultural units; the general lack of defined "phases" in South Dakota; the need to explain what the management document is doing; and how the document will change through time with the development of archaeological research in the state.

The term "study unit" was clearly being misunderstood or misused. It was Bob Alex's understanding that the 24-study unit division was an attempt to separate the state into regions within which research into "study units" per se would be conducted, with a view to eventually (after considerable research) remove the 24 regional boundaries and let the "study units" stand alone. At this meeting the participants decided to change the term "study unit" to "archaeological region" (CSDA 1986). The boundaries of the regions that utilized a drainage channel itself for divisions were also slightly changed. In order to accommodate both banks of a drainage within one region, such boundaries were moved one mile to the east or south.

At the Placerville meeting, the participants also agreed to update the draft document on an individual basis rather than at a communal meeting. The 24 regions were apportioned out to the members then present to update the information on the basis of the comments received. "Phases" were to be defined, provided the phases were documented in professional archaeological publications and/or sites were known that could be used to define such phases. Those sites in each region that were on the National Register of Historic Places were also to be noted. A specific format for updating all "archaeological regions" was to be decided upon by the end of 1987.

Due to a total lack of funding and prior commitments by all Council members, the updating suggested at the Placerville meeting did not materialize. Major changes also took place within the professional archaeological community of the state. Paramount among these changes was the death of State Archaeologist, Bob Alex, early in 1988. Later that year Tim Nowak, USACE Area Archaeologist, moved out of the state. Other changes occurred and it was not until late in 1988 that Jim Haug was officially appointed State Archaeologist. A grant to update the Management Plan was then obtained by the State Archaeological Research Center and archaeologist Dan Flemmer was assigned the task. However, shortly after starting work on the project Flemmer accepted employment elsewhere. A revised subcontract which provided the basic funding for the preparation of this document was then awarded to the Archeology Laboratory, Augustana College.

Other developments since 1984 that have influenced this project include the preparation in 1985 of the State's Historic Contexts Study Guide, "South Dakota Historic Contexts: Historical and Architectural Resources," later revised (SHPC 1989); the preparation of a synthesis of the White River Badlands Archaeological Region that provides the basis for the information given in this document for that region; and discussions with colleagues in adjoining states working on similar documents (e.g., Mike Gregg in North Dakota and Dennis Gimmestad in Minnesota).

A preliminary draft of this document was circulated to over 25 institutions and individuals in October, 1989. Comments were received from approximately a third of these groups, primarily from individuals associated with SARC, SHPC and USACE (Omaha District). Based on those comments, revisions to the draft focused on standardizing the formats used, clarifying the role of the document in the National Park Service planning process, identifying areas for future work, basic editing and providing an updated bibliography.

SECTION 2 - INTRODUCTION

What The Plan Does

This plan is designed to assist in the formulation of a series of goals, both general and specific, relating to the management of archaeological resources; to prioritize those goals; and to discuss realistic measures that can be implemented towards their attainment. Goals and priorities may become reordered as new discoveries are made or new factors come into play. The plan, therefore, is not a static document, but is designed to incorporate such changes. In addition to presenting goals and priorities, the plan discusses the current strengths and weaknesses of the state's archaeological preservation program. This information has a direct impact on the ultimate priority each goal is accorded in the planning process.

Goals are not developed in a vacuum; they are based on existing data (or the lack thereof). Therefore, the plan also provides a statement on the known archaeological resources in the state and a summary of past cultural resource activities, such as surveys, excavations, and collections research. This information is presented in two sections of the plan. Section 10 discusses a series of archaeological contexts or topics that encompass a conceptual framework, geographical distribution and chronological limits. A site's significance is better able to be determined if it can be assigned to a specific context. Section 11 presents information specific to each of South Dakota's 24 archaeological regions. Section 11 is particularly useful to individuals wishing to determine the extent of previous work in a specific region and the chronological range of known sites in that region.

Who Uses The Plan And Why

The plan is a public document. Its primary use is to enable preservation planning and to assist cultural resource managers with identifying, analyzing and determining the significance of groups of related archaeological resources. Once significance is determined, the appropriate preservation action relative to the resources can also be determined.

While the plan will be used by State preservation agencies, it will also be consulted by individuals, businesses and academic departments who perform cultural resource management (CRM) services for compliance purposes. The results from CRM projects provide much of the State's cultural resource database. The plan will assist in the formulation of recommendations concerning actions affecting cultural resources.

Closely linked to groups conducting cultural resource management projects are educational/academic institutions and individuals pursuing research topics associated with the state's archaeological resources. While the plan is not directly aimed at these individuals, researchers will no doubt find it a valuable reference for obtaining a general overview relating to their inquiries.

State and Federal agencies and other groups using State or Federal funds or requiring State or Federal permits may use the plan in the initial planning process to make a preliminary assessment of the nature of the cultural resources in their proposed project area. The plan is not, however, a set of guidelines for such agencies with regard to the fulfillment of review and compliance criteria. That information can be found in a document published by the South Dakota Historical Preservation Center entitled "Guidelines for Cultural Resource Surveys and Survey Reports in South Dakota" (February 1990).

In summary, the purpose of publishing this document is to provide cultural resource managers and the general public access to the same information utilized by the State Historical Preservation Center. These individuals may then understand how preservation decisions are derived and apply the plan to the archaeological resources with which they are concerned.

Planning enables us to organize the material we are dealing with into a coherent whole and evaluate it as a unit rather than as individual pieces; planning allows us to set methods and priorities for achieving these goals; planning allows us to organize our material, goals, and priorities for presentation in a comprehensive way to outside funding agencies, decision-making bodies, and the general public; finally, a well-formulated plan demonstrates that we understand our material...it indicates to others that we know **what** we want to do, **how** we are going to do it, and **why** it is important (after Dobbs n.d. [draft]:11; emphasis in original).

Purpose Of The State Plan

The purpose of the *South Dakota State Plan For Archaeological Resources* is:

to identify and protect cultural resources, to **evaluate the significance** of the information these resources can provide and to promote responsible use of these resources in archaeological **research and public education**.

The framework from which the South Dakota State Plan emerged was developed in the late 1970s and early 1980s when the National Park

Service initiated what was then called the Resource Protection Planning Process (RP3). The National Park Service initiated the RP3 process for the following purpose:

to develop a comprehensive historic resource management process which identifies and organizes information about a State's historic, archeological, architectural, and cultural resources into a form and process readily useable for producing high reliability decisions, recommendations, and/or advice about the identification, evaluation, and protection of these resources [U.S. Department of the Interior 1980:1].

The resource protection planning process assumes that the cultural landscape was created by non-random processes and that by identifying the significant roles in past settlement played by one or more key factors (e.g. political, economic or cultural systems, technology, environmental change, physiography, transportation networks, etc.) a practical framework can be developed for subdividing historic resource information and for establishing an underlying logic to historic resource planning for a State [U.S. Department of the Interior 1980:2-3].

The State plan must, therefore, meet National Park Service standards; it must allow for statewide planning and protection of resources; it must respond to the needs of its users; and it should outline intelligible approaches to attaining the stated goals.

The Secretary of the Interior's Standards for Preservation Planning (48 CFR, No. 190, Part IV) define preservation planning as:

...a process that organizes preservation activities [identification, evaluation, registration and treatment of historic properties] in a logical sequence. Preservation planning is based on the following principles:

-Important historic properties cannot be replaced if they are destroyed. Preservation planning provides for conservative use of these properties....

-To make responsible decisions about historic properties, existing information must be used to the maximum extent and new information must be acquired as needed.

-Preservation planning includes public participation....

-Preservation planning can occur at several levels or scales...[U.S. Department of the Interior 1983:44716-44717].

The *South Dakota State Plan For Archaeological Resources* and the *Historic Contexts for Historic and Architectural Resources in South Dakota* (SHPC 1989) provide information essential for implementing the National Park Service comprehensive preservation planning program. The required components of the State Comprehensive Preservation Plan, as well as the items which must be addressed within each context, are described in the Secretary of the Interior's Standards referred to above. Five areas of activity are recognized as constituting planning:

1. Identification or survey.
2. Evaluation or determining the significance of resources.
3. Registration or listing on the National Register of Historic Places.
4. Documentation or more thorough recording and analysis.
5. Treatment, which can be a wide range of preservation activities from development plans to restoration.

The State Plan for Archaeological Resources is most useful in carrying out the activities of identification, evaluation and registration.

Significance And Evaluation

Central to the planning process is the determination of the significance of any given cultural resource. The following evaluation criteria to determine the significance of cultural resources are found in Title 36 of the Code of Federal Regulations, Paragraph 60.4.

National Register criteria for evaluation. The quality of significance in American history, architecture, archeology, engineering, and culture is present in districts, sites, buildings, structures, and objects that possess integrity of location, design, setting, materials, workmanship, feeling, and association and

(a) that are associated with events that have made a significant contribution to the broad patterns of our history; or

(b) that are associated with the lives of persons significant in our past; or

(c) that embody the distinctive characteristics of a type, period, or method of construction, or that represent

the work of a master, or that possess high artistic values, or that represent a significant and distinguishable entity whose components may lack individual distinction; or

(d) that have yielded, or may be likely to yield, information important in prehistory or history.

Criteria considerations. Ordinarily cemeteries, birthplaces, or graves of historical figures, properties owned by religious institutions or used for religious purposes, structures that have been moved from their original locations, reconstructed historic buildings, properties primarily commemorative in nature, and properties that have achieved significance within the past 50 years shall not be considered eligible for the National Register. However, such properties will qualify if they are integral parts of districts that do meet the criteria or if they fall within the following categories:

(a) A religious property deriving primary significance from architectural or artistic distinction or historical importance; or

(b) A building or structure removed from its original location but which is significant primarily for architectural value, or which is the surviving structure most importantly associated with a historic person or event; or

(c) A birthplace or grave of a historical figure of outstanding importance if there is no appropriate site or building directly associated with his productive life; or

(d) A cemetery which derives its primary significance from graves of persons of transcendent importance, from age, from distinctive design features, or from association with historic events; or

(e) A reconstructed building when accurately executed in a suitable environment and presented in a dignified manner as part of a restoration master plan, and when no other building or structure with the same association has survived; or

(f) A property primarily commemorative in intent if design, age, tradition, or symbolic value has invested it with its own exceptional significance; or

(g) A property achieving significance within the past 50 years if it is of exceptional importance [36 CFR Part 60.4].

Criterion (d) "...have yielded, or may be likely to yield, information important in prehistory or history" is most generally quoted in support of an archaeological site's significance. Recently Butler (1987) addressed the concept of significance specifically with regard to criterion (d).

The key word...is 'important.' How does one measure 'importance?' Importance is based on the theoretical and substantive knowledge of the discipline....All federal agencies must know *why* a site is important...(and)...why a site is not important. Agency decisions are based on *supported* positive and negative recommendations [Butler 1987:821].

Butler notes that most archaeologists do not do cultural resource management, they do **archaeology** and make recommendations based on the theoretical and substantive knowledge of the discipline. Clearance is an agency responsibility and decision.

Carolyn Hale-Pierce (1984) has addressed the issue of integrating the small-scale survey into a research and management framework. She notes that:

Legislative directives require evaluation of the resources found on [cultural resource] surveys in order that *management* decisions can be made, while professional and scientific directives demand that archaeologists evaluate resources in terms of their *research* value....Research conclusions involve decisions about what will be recorded as data or not. Concomitantly, decisions to save or not save archaeological resources (are they 'significant' or not?) have implications for research, for they determine what kinds of data will be available for future researchers (McGimsey and Davis 1977:29). That **management practices can only change through a research process should be obvious** [Hale-Pierce 1984:5; italics in original, bold emphasis added].

On a practical note, what is observed during a surface reconnaissance survey does not necessarily reflect the significance of the resources that exist at a site. A single flake in a plowed field may represent the first disturbance to an otherwise pristine buried site; conversely, a dense surface artifact scatter may be all that remains of a multicomponent site. The latter offers very minimal research potential as it is impossible to differentiate component assemblages, whereas the former would be a highly significant cultural resource.

The potential for buried components (buried components by definition have high integrity and significance) is great in many areas of South Dakota, yet this is one aspect of cultural resource management compliance that is very difficult to address. When subsurface-disturbing projects are undertaken in areas with the potential for subplowzone components (e.g., the Badlands, the Sandhills, the loess cap terraces along the Missouri River trench), strategies (e.g., monitoring) need to be established to assess this potential.

Contexts - A Conceptual Framework

This document is primarily a planning tool for those concerned with preservation policies, cultural resource management and research. It functions primarily as an outline upon which more complete information will be built. As more work is done, additional data and analyses will be added to the plan.

Defining *CONTEXTS* is a major goal for the future development of this plan. Contexts consist of a set of historic resources, such as archaeological sites, related in terms of a conceptual framework ("a set of linked concepts that describe the nature of a set of historic resources and which have geographical and temporal limits") (Hale-Pierce 1984:8). A context is a resource or cultural unit possessing geographical and time limits. The key elements are: a) a conceptual framework; b) geographical distribution; and c) chronological limits.

Several of the contexts defined here are based on single artifact types, namely projectile points. The goal is to define these contexts more fully as cultural manifestations. Each context that proposes to pertain to a cultural group or groups, such as Clovis, Avonlea, Initial Middle Missouri or Sioux, will eventually be defined using a broad range of lifeway aspects including the entire artifact assemblage, the types of sites associated with that group, the time frame, the socio-political organization, subsistence strategies, and geographical area.

Critical to defining a context is the conceptual framework. It should be possible to assign sites to contexts without the recovery of specific "diagnostic" artifacts, i.e., with the general assemblage providing the context for the site. It is likely that several of the 'named' projectile point types defined here as individual contexts will be grouped within a single context as these contexts are more fully defined.

Property Types

Central to the National Register process is the concept of property type. Each historic context should contain a listing of known and expected property types. The National Park Service defines a property type as:

...a grouping of individual properties based on a set of shared physical or associative characteristics. Physical characteristics may relate to structural forms, architectural styles, building materials, or site type. Associative characteristics may relate to the nature of associated events or activities, to associations with a specific individual or group of individuals, or to the category of information about which a property may yield information....Property types can be based upon our predictions of what resources likely existed at a given place and time in history and our expectations of what their likely condition is today. However, most frequently they are based on information about known properties [U.S. Department of the Interior 1986:8].

Defining property types for archaeological resources is especially complicated as the material remains observed at these sites have been transformed by both cultural and natural actions. One approach to the problem is through the methods of settlement archaeology -- "the notion of settlement type may be readily translated into the property type definition required for the National Register" (Dobbs n.d.:31).

Most investigators in the Upper Midwest have adopted an analytical method to delineate settlement types, based on the profiles of artifacts and other cultural debris found at archaeological sites, and sometimes employing edge-wear analysis on artifacts from excavated contexts.

Some researchers have developed settlement types based on quantitative descriptions of debris profiles from various sites (e.g. Dobbs 1984; Dobbs and Shane 1982; Kvamme 1988; see also O'Brian and Lewarch 1981). These types have proven useful in settlement studies but do not always include a clear statement about site function. Benn (1987:26-28) has defined seven distinct settlement types...(including)...resource procurement station, single occupation bivouac, multiple occupation bivouac, temporary base camp, seasonal base camp, mounds, and unknown function sites....**The development of methods and procedures for delineating settlement types**

for each historic context is a task that should have a high priority as the planning process is implemented [Dobbs n.d.:31-32; emphasis added].

In South Dakota a series of site or property types has been defined which is currently in standard use. These types are listed in the State Archaeological Research Center site form manual as follows:

alignment (drive lines, medicine wheels, petroforms);
artifact scatter (lithic scatters, chipping stations, etc. Generally thin deposits, can be buried; can include aboriginal and/or historical material);
burial (cemetery, ossuary, single burial, but not mound);
cabin (remains of sod hut, dugout, log cabin, etc.);
cairn (pile of rocks, does not include farmers' rock piles);
dam (earth, stone, or concrete dam);
depression (can include collapsed root cellar, dugout remains, etc.);
dump (refuse pile or area);
earthlodge village (note the term "earthlodge");
earthwork (miscellaneous earthworks);
farmstead (farm or ranch building/outbuilding ruins, a site type which can include cabins, foundations, depressions, etc. collectively);
faunal/paleontological (bone bed, fossils, no direct evidence of cultural association);
fort (historic military or civilian fortification; complex type which can include other types such as foundations; overlaps with trading post type);
foundation (isolated building foundation);
hearth (isolated aboriginal firepit or hearth);
industrial (mines, quarries, sawmills, flumes, etc.);
isolated find (single tool or few [less than 10] artifacts with no possibility of buried or other remains);
kill (jump, impoundment, surround);
mine (historic mine or quarry [includes structural features]);
monument (marker other than grave);
mound (burial mound, linear, temple);
nonfarm ruins (house and outbuildings, livery stables, etc.; a complex type which can include depressions, foundations, cabin, etc.);
occupation (similar to artifact scatter but possibly multicomponent, lots of features, some depth apparent. Usually has Register potential. Sort of intermediate between village and artifact scatter);
quarry (aboriginal quarry or lithic source);
railroad (railroad bed and track);
road (old wagon trail, roadbed, etc.);
rock art (petroglyphs, pictographs);
rock shelter (cave, shelter, overhang);
stone circle (tipi rings);
townsite (can be town or similar complex of structures, possibly containing depressions, foundations, etc.);
trading post (trader's post or fort; complex type which can include other types such as foundations; overlaps with fort type);
village (any large habitation site with dense remains, features, faunal remains, etc. [i.e., more than an occupation]--a large Woodland habitation site, for instance).

As property types are better defined through the planning process, the above list will be amended to maintain an up-to-date inventory.

State Comprehensive Preservation Plan Philosophy

Crucial to the development of a comprehensive philosophy to guide preservation activities concerned with the prehistoric past is a full appreciation of the complexity of that past in South Dakota, the region and the nation. South Dakota exhibits extreme physiographic diversity, with landscapes ranging from the Black Hills, the Badlands, and the North Cave Hills in the west; to the Missouri River Trench in the central area; the James and Big Sioux River valleys in the east; and the prairie pothole region of the northeast. Each of these unique ecotones required highly specialized adaptive strategies on the part of prehistoric human groups who occupied the areas and utilized the resources. South Dakota may be viewed as a Northern Plains "laboratory" where prehistoric human groups tested and adapted life ways over a period spanning at least 11,000 years. The record of the prehistoric past is interpreted through the discipline of archaeology. When revealed, this record provides the basic data for comprehending the successes and failures of human groups in the past. The importance of that record was well stated by Loren Eiseley when he noted that..."Without knowledge of the past, the way into the thickets of the future is desperate and unclear" (1978:150).

The archaeological record in South Dakota has disclosed that nomadic hunters of extinct forms of mammoth and bison, known as the Clovis culture, were present 11,000 years ago. From the presence of this early and likely sparse human population, the record continues over many millenia, demonstrating expanded populations who hunted and experimented with the collection of wild edible plants. Since habitat and climate directly affect the plant and animal population, human groups found great diversity throughout what is today South Dakota. The higher elevational areas in the west produced cultural responses and food selections quite different from the exploitation of resources along the major drainages such as the Missouri, James and Big Sioux rivers in central and eastern South Dakota. Perhaps most importantly, the vast grasslands of South Dakota provided a storehouse of untold plenty with the grazing herds of bison.

Prehistoric peoples who gradually migrated into this region from areas to the east and south, generally referred to as "Woodland" groups, brought new cultural ideas and introduced domesticated crops such as corn, squash, beans and tobacco to this area of the Plains. The amalgamation of human lifeways resulted in the evolution of village

cultures who focused their activities along the major river drainages of the state. The prehistoric record, as currently understood for this region, reveals that human groups gradually established complex lifeways, forming the basis for cultural systems that existed into the historic period. South Dakota was home to a number of historic Native American groups, including the Mandan, Hidatsa, and Arikara village cultures, as well as the nomadic Sioux and Cheyenne. The social, political and economic structures of the Plains peoples at the time of Euro-American incursion into the region were complex and sophisticated. Elaborate inter- and intra-tribal systems of trade that had been developed over several millenia existed and spanned thousands of square miles. These networks brought exotic raw materials to the area such as obsidian from the west, and copper and ocean shell from the east and south, as well as the ideology of other cultural systems in the New World. The earliest Euro-American trappers and traders to enter the Plains region lived to a degree within the existing native social, economic and political networks. However, significant differences in lifeways also existed between the Euro-American and native cultures. These differences, coupled with the catastrophic decimation dealt to all New World populations by the introduction of European diseases, crippled and ultimately crushed the Native American tribal systems.

From the brief overview presented above, it is clear that South Dakota is a state with a rich heritage of cultural resources and regional traditions. The knowledge, understanding and insights to be gained from investigating the past are compromised each time a resource is destroyed. Protection of these diverse and irreplaceable resources is a complicated task, made even more difficult by South Dakota's limited economic base and small population. Pragmatically, the philosophy guiding cultural preservation in South Dakota, as in any other state, must be developed within existing contexts and constraints. The stakes are high because cultural resources are non-renewable resources.

Given the state's limited economic base and small population, South Dakota's philosophical approach to protecting cultural resources must be practical, efficient and comprehensive. Administrative practices, promotional activities, research projects and protection strategies must be effective and well thought-out. Efficiency means the careful allocation of resources to basic requirements and to long-range endeavors with superior potential. It also means the distribution of preservation responsibility to as many individuals, agencies and institutions as possible.

Comprehensiveness means relating preservation to a broad range of specific individual, institutional and organizational interests present in South Dakota's social and economic systems. It involves establishing ways in which businesses, industries, homeowners, public officials and educators can incorporate preservation to achieve diverse goals. It allows people to appreciate cultural resources on many levels.

Finally, there is a realization that the fate of cultural resources rests in the hands of landowners and local residents. Those resources will survive only if local people want them preserved. Local opposition or apathy, on the other hand, will accelerate the destruction of resources. A state program can provide information, encouragement and preservation incentives but in the end it is the public that makes preservation work.

Preservation Policies

The general policies of the State Historic Preservation Program are listed below. These policies are followed by goals specific to the state's archaeological resources.

1. A strong historic preservation program involves the inclusion of a wide range of individuals and institutions throughout its jurisdiction. The state will encourage the formation of organizations and commissions dedicated to the protection of historic resources. It will also create alliances with local, state and federal entities for the protection of resources.

2. Legislation is an effective means of supporting preservation. The state will consistently encourage the creation of statutes which provide preservation benefits and which prompt consideration of historical values in decisionmaking. Additionally, statutes which secure resource protection and allow for the promotion of historic properties will be pursued.

3. The isolation of historic resources from the economic and social fabric of the community serves to diminish the value of those resources to modern society. The state will encourage the proper interpretation of cultural resources for the enrichment of the community.

4. The primary factor influencing the future of cultural resources in South Dakota is economics. Goals which appeal to economic interests within South Dakota and link preservation and economic development will consistently be pursued. Of particular value is the relationship

between historic and prehistoric attractions and tourism. The state will undertake a major effort to include preservation in tourism strategies.

5. Historic preservation planning is fundamental to effective resource protection. The state will encourage the creation and use of historic preservation plans on all levels of government.

6. Every South Dakota region, community and neighborhood includes places significant to local history and prehistory. The state will recognize those places with sufficient integrity to represent that past. Furthermore, the state will encourage protection of locally significant cultural resources to retain South Dakota's historical image for the edification and delight of residents and visitors in future centuries.

7. Many historic resources will be lost as the trends of declining rural population and weakening rural economy continue. In many instances, the state will have no alternative but to recommend recordation as a means of preserving rural historic and prehistoric resources.

8. Education is an essential component of a comprehensive historical preservation program. Whenever possible the state will make educational services and materials available to schools, colleges and universities, state and federal agencies, institutions, groups and individuals.

9. Historic and prehistoric resources are educational tools particularly as sources for teaching local history. The educational value of cultural resources shall be included in South Dakota's historical preservation goals and priorities.

Statewide Goals For Archaeological Resources And Prehistoric Site Preservation

1. To preserve significant cultural resources within each defined archaeological context.
2. To promote academic research into the cultural resources by encouraging expansion of undergraduate and graduate programs in Archaeology/Anthropology in the state.
3. To communicate with and educate the public about the past, including closer cooperation with museums and cultural heritage centers.
4. To continue improving criteria used to evaluate site preservation goals.
5. To continue expanding Native American interest and direct involvement in archaeology.
6. To more widely and professionally disseminate information about the cultural resources of the state.
7. To actively promote the South Dakota Archaeological Society and its associated chapters and expand avocational participation in the preservation process.
8. To increase resources (money and people) available to address preservation goals.

Current Strengths of South Dakota's Archaeological Preservation Program

South Dakota possesses cultural resources of local, national and international significance. Twelve sites are listed in the catalog of National Historic Landmarks. Significant cultural resources are distributed throughout the state and are present in every county.

Certain cultural resources lend themselves well to public education and tourism and are easily accessible (e.g., the Mitchell Prehistoric Indian Village and Fort Randall). Interpretive projects are currently being developed at both of these sites.

The Missouri River Trench in South Dakota was the focus of major prehistoric horticultural village settlements and, archaeologically, is a

highly significant region for the study of the rise of sedentary (village) human living systems.

There is a small but strong core of public support for preservation activities in South Dakota. Historical projects are generally favorably received and the legislature is disposed to assisting preservation through tax incentives and enabling statutes. Federal and state agencies, local governments and mining companies have all provided a measure of cooperation towards preservation issues. Such interest needs to be supported and extended to other groups and other areas.

A large number of South Dakotans who have participated in historic preservation issues understand the concept of preservation and are willing to lend it support. The State Historical Society and the Office of History consider preservation to be an important component of South Dakota's program of heritage protection.

Current Weaknesses of South Dakota's Archaeological Preservation Program

Only a very limited undergraduate academic program exists within the state in Archaeology/Anthropology and there is no graduate program. In comparison with many other states there are relatively few professional archaeologists located in South Dakota.

There is a long history of "pothunting" across the state that continues to destroy numerous sites and the valuable information they contain. The Missouri River Trench represents the most concentrated number of archaeological sites in South Dakota. The inundation of the reservoirs during the 1950s destroyed many significant sites, some of which received little or no study.

Many of the remaining sites along the Missouri River Trench continue to be threatened by erosion, fluctuating water levels and vandalism. The federal land-managing agency responsible for the care of the cultural resources along the Missouri River Trench is the U.S. Army Corps of Engineers (USACE), Omaha District. Unfortunately, despite budget requests by the USACE archaeologists, the preservation and salvaging of these cultural resources has not been accorded a high enough priority to receive funding in recent years. Without adequate protection and educational programs, publicizing important sites may lead to further destruction (vandalism) of those resources.

The size of the state is vast when compared with the state's population. The necessary resources (people and money) are simply not available to meet the current pressures affecting archaeological sites and those pressures are likely to increase.

Selected Specific Goals And Topics Relating To Preservation Planning

1. Tourism

The prehistoric and historic archaeological resources of South Dakota offer a wealth of opportunity for promoting tourism in the state. While tourism often connotes problems for the scientific community, the proper interpretation of cultural resources for visitors and the general public should be beneficial to both the state and the professional archaeological community. One goal of preservation planning is to address the issue of tourism and cultural resources and suggest ways in which the two can be linked for the benefit of all concerned. The state will undertake a major effort to include preservation in tourism strategies.

2. Legislature

While education is a primary means of ensuring that cultural resources are preserved, one goal of preservation planning is to back-up the policies outlined in this and other preservation planning documents with legislation. Specific issues include human remains, trafficking in artifacts, vandalism, and restoration of cultural resources. The state will consistently encourage statutes which provide preservation benefits and which prompt consideration of historical values in decisionmaking. Additionally, statutes which secure resource protection and allow for the promotion of historic properties will be pursued.

3. Review and Compliance Requirements

As part of the preservation planning process, the State Historical Preservation Center issues requirements for review and compliance reporting. These requirements are updated yearly (if necessary). One goal is to review the requirements regularly and ensure that they take account of the most recent archaeological practices and theory pertaining to the prehistory and history of South Dakota.

4. Vandalism/"Pothunting"

Vandalism is a critical issue in preservation planning and is caused both by action and by inaction. Active vandalism, such as illegal looting of sites, can be approached through education, policing and legislative actions. Vandalism caused by inaction is a problem specific to those agencies, state and federal, which are charged with the management of cultural resources and which elect to take no action to protect and preserve significant resources. This is a particularly

pressing issue along the Missouri River where active shoreline erosion degrades and exposes the cultural resource base daily.

5. Geomorphology

To plan for the preservation of cultural resources it is necessary to determine where those resources are located or are likely to be located. It has long been recognized that surface examinations reveal only resources with a surface manifestation. Many features in the state, such as the Holocene loess-capped Missouri River terraces; the alluvial sediments and alluvial fans associated with river valleys; and the complex sedimentary circumstance in the Badlands present buried landscapes seen only in vertical exposures. Both for planning purposes and for accurately interpreting the distribution of cultural resources within the state, a greater understanding of the geomorphology of the state is necessary.

6. Education

The role of education in the preservation planning process has been referred to on numerous occasions. A strong commitment towards education already exists on the part of the State Historical Preservation Center, the State Archaeological Research Center, and other professional archaeologists in the state. These groups provide personnel to give talks, promote and participate in an Archaeology Awareness Weekend, and produce educational materials. The goals for the future include expanding on all these activities and reaching students at the elementary, junior high, senior high, college and graduate levels.

7. Public Awareness, Involvement and Promotion of Activities

In addition to the goals discussed under education and tourism, other avenues for promoting public awareness such as television, radio, and video productions will be pursued. Public participation has also been encouraged through activities sponsored by the South Dakota Archaeological Society and by agencies such as the SHPC and USACE which have conducted "volunteer" excavations and developed the site steward program.

8. Standardizing Analytical Procedures

To aid in the interpretation and evaluation of all cultural resources, a standardized series of analytical techniques must be applied to the material remains. Clearly, budgetary restraints limit what individual researchers can achieve, and there should be no restrictions applied to individual projects. The State Archaeological

Research Center is in the process of providing guidelines for standardized terminology and suggestions for basic analytical procedures that should be performed.

9. Standardizing terminology (taxonomy, artifact types, etc.)
See 8 above.

10. Absolute Dating (promoting funding for radiocarbon and other dating techniques)

One of the most critical factors in determining the significance of a cultural resource is the dating of that resource. For many researchers, a resource which cannot be dated has little or no significance. Dating can be absolute or relative. With advances in radiocarbon dating techniques even very small quantities of charcoal can provide a date. It may also be possible for geomorphological studies (5 above) to provide a limited time frame for sites located on some terrace surfaces. A preservation planning goal, therefore, is to encourage the use of dating techniques to provide a better context for the evaluation of the resources in the State.

General Comments

This document is designed to be used for both research and planning. These two activities are not mutually exclusive, but each has a different set of primary needs. Researchers will probably utilize the context section to the greatest degree, while planners will refer initially to the archaeological regions. Given a specific planning project, the first stage is to identify the region(s) in which that project is located. A description of the region, a discussion of previous archaeological work, and a summary of the cultural resources known are provided in the section on archaeological regions. References provided in that section can be used to obtain more detailed information, if required.

Once specific information is available with regard to site types in a project area, the appropriate context(s) can be addressed. Under each context an evaluation section is provided which supplies one indicator for assessing the significance of any resources located which relate to that context.

The current document pertains to archaeological resources of the prehistoric period, approximately pre-A.D. 1750. The contexts for the historic period are found in the document HCHARSD (SHPC 1989). The next update of that document will address historic archaeological resources as well. Users who are dealing with resources ranging from the prehistoric to the historic period need to use both documents.

This document, the *South Dakota State Plan for Archaeological Resources*, should be consulted and used whenever any of the following activities are undertaken:

1. Archaeological resources survey.
2. Archaeological resources evaluation for National Register eligibility.
3. National Register nomination preparation.
4. Preparation of State Historical Preservation Center grant applications.
5. Preparation of historic preservation planning activities.

Public Comment and Involvement

The State Plan is a public document and constructive comments and suggestions are always welcome.

Distribution

The original draft of this document was distributed free of charge to a list of individuals and institutions identified by the State Archaeological Research Center. If you did not receive a copy and would like to obtain one, along with future updates, please contact that office.

This update will be distributed free of charge to those who received the original draft. However, future updates will be sent only to those who wish to continue to receive updates and the cost of copying, handling and postage will be charged. If you wish to be placed on that list please submit your name and address to the State Archaeological Research Center, P.O. Box 5005, Rapid City, SD 57709-5005 and clearly mark the letter STATE PLAN UPDATE REQUEST.

Updating Procedure

Updates to this plan will appear periodically but comments can be submitted at any time. No further formal "requests for comments" will be issued per se. Persons submitting additions to the plan or requests for deletions should send accompanying references. No changes will be made to the factual content of the plan without documentation to validate those changes.

The State Historical Preservation Center and the State Archaeological Research Center will determine when the next completely revised draft will be issued. It is anticipated that the next draft will be internally complete, redesigned and reformatted.

Who To Contact For Information And Availability Of The Document

Copies of the State Plan are available for review at:

**State Historical Preservation
Center
3 East Main
P.O. Box 417
Vermillion, SD 57069-0417
[Phone: (605) 677-5314]**

**State Archaeological Research
Center
2425 East St. Charles
P.O. Box 5005
Rapid City, SD 57709-5005
[Phone: (605) 394-1936]**

In addition to writing or calling, there are opportunities throughout the year to meet with personnel involved with development and use of this document. Call one of the above offices for details.

SECTION 3 - INTRODUCTION TO THE SOUTH DAKOTA STATE PLAN FOR ARCHAEOLOGICAL RESOURCES

This document is one in a series of documents that, when completed, will form the South Dakota State Historic Preservation Plan. It is currently defined as a "working draft" because most of the historic contexts and management regions still require completion.

The main thrust of this revised draft is to provide a document that addresses both research and management issues in a practical format that can easily be updated and amended. The document uses the terms *CONTEXTS*, *OPERATING PLANS* and *ARCHAEOLOGICAL REGIONS* to form the primary organizational structure, with cross-referencing among the three components. Thus, for each historic context a map showing the archaeological regions containing historic properties relating to that context is provided. Within each archaeological region the historic properties are discussed in terms of historic contexts.

The three organizational components transform technical information on archaeological resources into a more useable form for the decision-maker. These organizational components are defined as follows.

CONTEXTS: Contexts consist of a set of historic resources, such as archaeological sites, related in terms of a conceptual framework ("a set of linked concepts that describe the nature of a set of historic resources and which have geographical and temporal limits") (Hale-Pierce 1984:8). A context is a resource or cultural unit possessing geographical and time limits. The key elements are: a) a conceptual framework; b) geographical distribution; and c) chronological limits.

OPERATING PLANS: Operating plans detail practical goals and priorities for managing resources in contexts by providing answers to questions in the categories of identification, evaluation, and treatment (protection).

ARCHAEOLOGICAL REGIONS: South Dakota has been divided into 24 archaeological regions (Buechler 1984a [originally termed study units]). These regions form the basis for determining the geographical distribution of each context that is defined, i.e., the spatial distribution of a context will be defined on the basis of the number of archaeological regions within which historic properties assigned to that context occur.

The summary of each archaeological region presented will include a list of all contexts to be found within the area. As such, these regions will serve as *MANAGEMENT UNITS*. Management units are formed by the overlap of contexts when projected on a map. They are utilized by planners to determine which contexts (and therefore operating plans) are found in a given project or planning area. They are the necessary link between the resource assessment and management decision-making (Hale-Pierce 1984:8).

Supporting Documents

It is anticipated that the cultural resources identified for each archaeological region will be synthesized as separate reports. Presently volumes are in preparation for the White River Badlands Region, the Upper Big Sioux Region, the Lower Big Sioux Region, the Belle Fourche Region, the Lower James Region, the Middle James Region and the Upper James Region.

Contact period and historic archaeological resources are to be addressed in the next revised edition of the HCHARSD (SHPC 1989). That document currently addresses only historic and architectural resources in South Dakota (not historic archaeological resources). It is also anticipated that studies of specific historic contexts will be undertaken periodically, resulting in additional reports relevant to the planning process.

SECTION 4 - TRADITIONAL CULTURAL PROPERTIES AND HUMAN REMAINS

A number of traditional cultural properties or sacred sites exist in the state. Many of these sites lack any obvious signs of human use (artifacts, features, etc.) and include hills, springs, caves, large glacial erratics and other natural aspects of the landscape that Native American groups currently hold or previously held sacred to their culture. Discussions with Native American groups are often the only way to ascertain whether such sites are within a project right-of-way, and there is often a dispute as to whether a sacred site has historical validity or not (i.e., has a history of being a sacred area). The archaeological community within the state has striven to accommodate the interests and concerns of the Native American peoples and welcomes input from the Native American community on these matters.

The issue of human remains has been a particularly sensitive topic, for obvious reasons. There is no way to totally avoid the disturbance of human burials caused by construction projects and/or by erosion along the major drainages, particularly along the Missouri River. Most of the remains disturbed by these activities are Native American because of their occupation of the area over at least the last 10,000 years. In addition, a greater number of Euro-American burials are defined with grave markers.

Cultural resource surveys undertaken ahead of construction projects may be able to discern burial mounds that will potentially be impacted. In most cases, burial mounds have been plowed down so extensively that little or no trace remains, while the interment may actually be present just a few centimeters below the plowzone.

South Dakota does have a policy of reburial after study which has worked well in the case of recent projects. State regulations (Administrative Rules of South Dakota 24:52:04) provide for notification of the state archaeologist when an unregistered grave is discovered on property owned by the state or its subdivisions. The state archaeologist then consults with appropriate law enforcement officials and the local coroner to determine whether they have an interest in the remains. Remains recovered by the state archaeologist will be examined by a forensic osteologist (Willey 1989; Willey et al. 1987) and will be reinterred within 5 years of discovery except in cases of mass burials or those determined to be of extreme scientific importance. Remains may be released to next of kin or the specific group or tribe to which they belong in those cases where such identification is possible.

SECTION 5 - ENVIRONMENT AND GEOMORPHOLOGY

During the course of developing this planning document, the need for more statewide geomorphological research became quite clear. There have been some studies of late Pleistocene and Holocene landform development, particularly relating to the Missouri River terraces and to Holocene loess deposition. Major environmental changes which have drastically transformed the Badlands landscape over the last 10,000 years have also been evaluated. Similar studies need to be performed in all archaeological regions of the state.

At this point in time, most cultural resource management surveys are surface evaluations, with subsurface cultural deposits being evaluated, if at all, by haphazard small diameter coring or shovel tests, rarely taken to depths greater than 50 cm. While this type of study may provide a relatively unbiased view of a region's cultural resources when there has been little or no soil accumulation or extensive deflation across the landscape, in all regions there are local situations in which sites will be deeply-buried.

Extensive deep-testing cannot be undertaken across the entire landscape, and should be limited to areas with a high potential for buried cultural materials. Nonetheless, deep-testing should be undertaken in more instances, particularly where projects impact floodplains, loess-mantled terraces and hilltops, and in the Badlands and Sandhills regions. An alternative to testing would be monitoring. Without such studies the loss to the state's cultural heritage is potentially great. Buried sites are likely to have high integrity and significant research potential.

A knowledge of the changing environmental conditions in the state over the past 20,000 years is critical to interpreting the cultural resources located. While there are disagreements among researchers as to the actual timing and effects of climatic events, a series of broad changes in the climatic and vegetational circumstances have been documented for the state. Table 5.1 and Figures 5.1 and 5.2 illustrate some of the major environmental changes.

Table 5.1. Postulated Climatic Episodes and Events in the Big Bend Region [abstracted from Wendland 1978] (after Ahler and Toom 1989:Table 2.1).

DATES	EPISODES	EVENTS
10,000 B.C.	Late Glacial	Cooler, wetter than present, conifer-hardwood forest.
8000 B.C.	Pre-Boreal	Warming trend, replacement of conifer-hardwood forests by grassland.
7300 B.C.	Boreal	Increasingly continental climate, grassland predominates.
6500 B.C.	Atlantic	Much drier and warmer climate, more Pacific and less Arctic airflow, maximum expansion of grassland.
3100 B.C.	Sub-Boreal	Increased precipitation, cooler, more Arctic airflow.
800 B.C.	Sub-Atlantic	Climatic deterioration.
A.D. 300	Scandic	Warming trend, transition period.
A.D. 700	Neo-Atlantic	Increased moisture, warming trend peaks.
A.D. 1100	Pacific	Return to drier conditions.
A.D. 1550	Neo-Boreal	Cooler, wetter climate, Little Ice Age.
A.D. 1850	Recent	Present conditions.

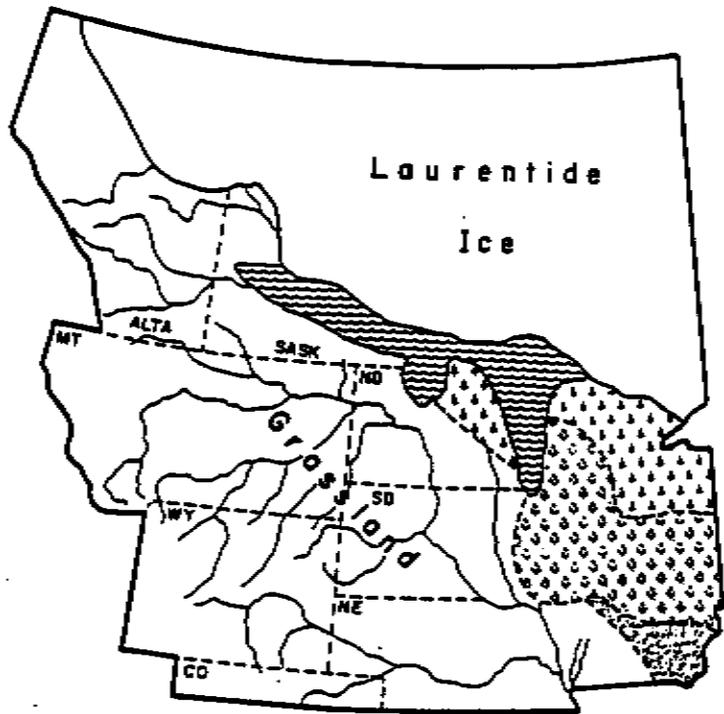

Figure 5.2. Gross approximation of Laurentide ice front (from Bryson et al. 1970:57) and major ecotones (from Wendland 1978:276) at ca. 9000 B.C. [top] and at ca. 8000 B.C. [bottom] (from Brown et al. 1983: Vol. 2, Pt. 1:Figure 3.10).

SECTION 6 - TAXONOMIC DEFINITIONS

One of the primary tasks for archaeologists in South Dakota at this time is to refine and define the archaeological record in terms of explicit taxonomic units. This section provides a brief introduction to certain taxonomic terms that have been used or are in use in the state. The focus of this discussion is on Middle Missouri taxonomy and it is primarily based on articles by Krause (1977, 1989) and Tiffany (1983). Later drafts of this document will modify and expand this section to include taxonomic approaches used in areas off the Missouri River trench.

In 1977, Krause (1977:5-13) presented a paper that examined Donald J. Lehmer's 1954 response to the limitations of the Midwestern Taxonomic System (MTS); discussed Lehmer and Caldwell's attempt to introduce the Willey and Phillips Phase-Tradition-Horizon System; and, finally, interpreted the taxonomic modifications Lehmer introduced in his final synthesis of Middle Missouri prehistory.

The Midwestern Taxonomic System is composed of six taxon - component, focus, aspect, phase, pattern and base (McKern 1939:301-313), while in practice the system is usually restricted to component, focus and aspect. A component cannot be a member of more than one focus and a focus cannot be a member of more than one aspect. The MTS explicitly excludes time and space. Within the logic of the MTS, taxa must be formed on the basis of their content before a set of applicable years can be proposed (Krause 1977:8).

The Willey and Phillips Phase-Tradition-Horizon System, on the other hand, creates the basic taxa by the intersection of values along the dimensions of space, time and content. The taxa created by contrastive values along these dimensions are phase, horizon and tradition. The phase is a classificatory taxon, and horizon and tradition are integrative taxa (Krause 1977:8). The variable of space is broken into five categories: site, locality, region, subarea and area. Two categories make up the temporal variable: local and regional sequences. The component, subphase, phase and culture are all discussed as formal or culture content variables (Zeier 1982:29).

Currently, the Willey and Phillips System is being applied, but often this application has been uneven. Tiffany notes two reasons for this circumstance: 1) the Willey and Phillips system does not consistently define some of its taxa; and 2) Plains researchers have substituted Willey and Phillips' "phase" for the "focus" taxon usually without regard for the spatial and content limitations placed on the "phase" in the Willey and Phillips (1958:22) definition (Tiffany 1983:98).

Figure 6.1 (from Tiffany 1983:Figure 4:99) shows the hierarchical relationships among the Willey and Phillips taxonomic units.

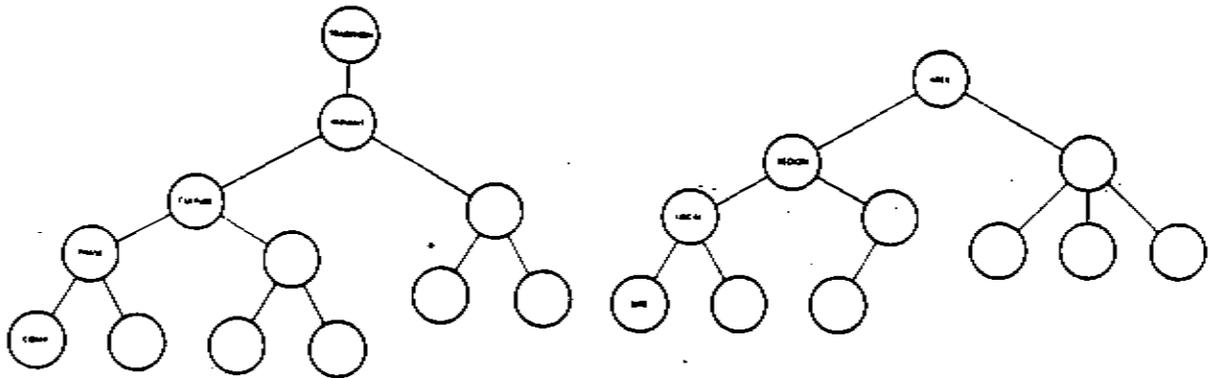

Figure 6.1. Hierarchical relationships among the Willey and Phillips taxonomic units.

Willey and Phillips describe these taxa as follows:

Phase. An archaeological unit possessing traits sufficiently characteristic to distinguish it from all other units similarly conceived whether of the same or other cultures or civilizations, spatially limited to the order of magnitude of a locality or region and chronologically limited to a relatively brief interval of time (Willey and Phillips 1962:22).

Horizon. A primarily spatial continuity represented by cultural traits and assemblages whose nature and mode of occurrence permit the assumption of a broad and rapid spread (Willey and Phillips 1962:33).

or

The horizon is characterized by its relatively limited time dimension and its significant geographic spread. It is usually expressed by an art style or a very specific complex of features whose historical uniqueness cannot be mistaken (Willey and Phillips 1955:723-724).

Tradition. A (primarily) temporal continuity represented by persistent configurations in single technologies or other systems of related forms (Willey and Phillips 1962:37).

Krause (1977:9) comments that to adequately use this system:

1. Phases must always have the greatest content.
2. Traditions must always have the greatest time depth.
3. Horizons must always have the greatest spatial spread.
4. Traditions and horizons may have roughly equal content but must have less content than any single phase.
5. Phases and traditions may have roughly equal spatial dimensions but must have less than a horizon.
6. Phases and horizons may have roughly equal time spans but must be less durable than a tradition.

Since the Willey and Phillips System was introduced it has met with criticism (Spaulding 1957) and attempts at modification. Notable modifications include Lehmer and Caldwell's (1966) redefinition of "horizon," their distinction between technological and cultural traditions and their use of the spatial term "districts." The latter (districts) were redefined by Lehmer (1971:28-29) as "regions." Lehmer (Krause 1969:95, 1977:10; Lehmer 1971:32) also added the concept "variant."

Lehmer defined the concept of **variant** as follows:

...a unique and reasonably uniform expression of a cultural tradition which has a greater order of magnitude than a phase, and which is distinguished from other variants of the same tradition by its geographic distribution, age, and/or culture content [Lehmer 1971:32].

In discussing Middle Missouri taxonomy, Tiffany suggests that: ...one way to clarify the usage of the formal units "phase" and "culture", and to provide a constructive means for comparison, would be 1) to treat time as an independent variable by establishing a temporal model for the Middle Missouri tradition, and 2) to leave the definition of spatial units as dependent variables of the formal units of culture and phase. In other words, rather than define regions independently of content data, as has been done for the Middle Missouri tradition, regions should be defined on the basis of the extent of a particular formal taxonomic unit such as "culture". Likewise, the spatial

extent of a "locality" should be determined by the maximum extent of a phase [Tiffany 1983:100].

Krause (1989) discusses the implications of adding a new mid-range classificatory unit, the population, to the Willey and Phillips System, and his arguments are outlined in his article. He summarizes his proposal by stating that:

...given a commitment to the general theory of evolution currently popular among archaeologists: (1) components may be interpreted as communities; (2) populations may be interpreted as system states, i.e., multicomunity energy matter and information exchange climaxes; (3) phases may be interpreted as multi-population system trajectories; (4) traditions may be interpreted as time durable multi-phase information exchange routes; and (5) horizons may be interpreted as multi-phase matter and energy exchange routes [Krause 1989:288-289].

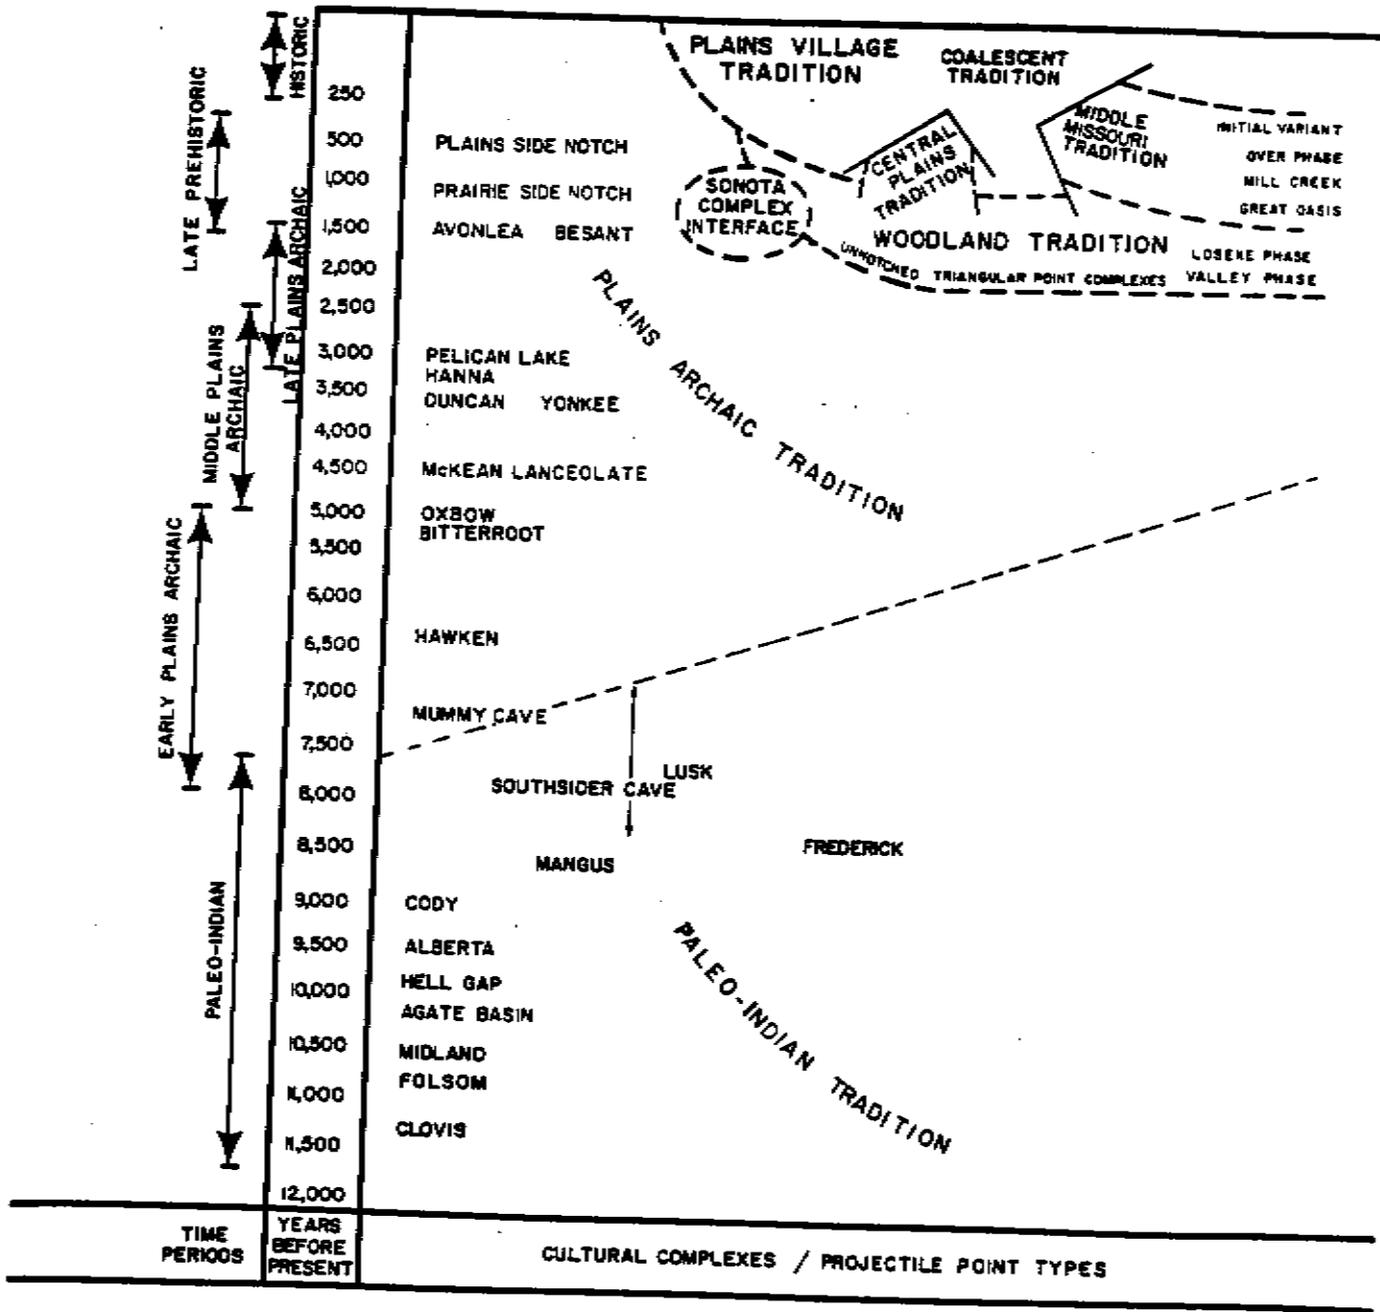

Krause ends by challenging Plains archaeologists to systematically address taxonomic issues "if taxonomic issues continue to be ignored, if the ad hoc labeling practices that are so much a part of our past are continued, the growth of understanding will be inhibited more than stimulated" (Krause 1989:289).

SECTION 7 - CHRONOLOGY

A number of chronologies have been proposed for South Dakota and many published reports provide extensive discussions and summaries which will not be reiterated here. Reference is made under each archaeological region to those reports to which the reader is referred.

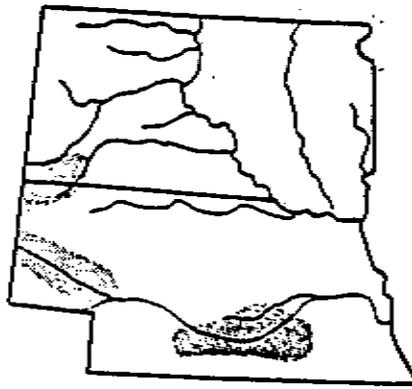

Major regional chronologies have been produced for the Black Hills, the Badlands and the Sandhills in south/southwestern South Dakota; the North Cave Hills and the Custer National Forest in northwestern South Dakota; the Middle Missouri Region in central South Dakota; and the James River, the Northeast, and the Big Sioux River regions in eastern South Dakota.

While a general chronological sequence from the Paleoindian period through the Archaic and Woodland/Late Prehistoric, to the Plains Village, Protohistoric and Historic periods is applicable across the state, the periods are variously defined and have been given dissimilar emphasis in the different regions. Figures 7.1-7.2 and Tables 7.1-7.6 provide summaries of cultural sequences/chronological models from a few of the synthetic reports, primarily for western and central South Dakota, but also including chronologies derived for adjoining states (southeastern Montana, northwestern Iowa, and the Upper James River valley, North Dakota).

SECTION 8 - HISTORIC CONTEXTS - THE CONCEPTUAL FRAMEWORK

How The Contexts Are Defined

The question of what constitutes an historic context is much debated. The definition supplied earlier, i.e., that a context (study unit) is a **resource** or **cultural** unit possessing geographic and time limits, is rather broad. Some states have chosen to focus primarily on the term culture in their definition of contexts. In this document, the term context can apply to any clearly-defined area of study, providing it possesses a theme, geographical limits and chronological period. Thus, an artifact type (e.g., Pelican Lake projectile points), a site type (e.g., stone circles), a manufacturing process (e.g., fluting), or an entire cultural system (e.g., Arikara) can be defined as an historic context.

The potential number of contexts is, essentially, infinite. Every specific projectile point type, every ceramic type, every "phase," every "focus," every "tradition," every known ethnic group to have passed through the state, and every defined site type (e.g., mounds, rock art, stone circles) could be a context. Similarly, studies such as "heat treatment of lithics during the Plains Archaic," or "Avonlea subsistence strategies," or "bison hunting during the protohistoric period" could also be defined as contexts. It is not the intention of this document to limit the available contexts, but rather to address those contexts which reflect the state of the knowledge at this time in South Dakota.

How Contexts Are Organized In This Document

A series of primary contexts is defined which essentially reflects the major accepted temporal/cultural periods in the state. Next, a series of subcontexts is listed. Some of these items are further expanded using available information; others are only listed and await fuller definition in the future. The defined contexts and subcontexts generally relate to suggested cultural groups, although not all the named artifact types in South Dakota definitely represent discrete archaeological cultures. Indeed, at the present time this "plan" is heavily biased towards projectile point typology (the product of the antiquarian past!) and, as reviewers have commented, the "contexts" need to be more completely defined as isolated or interacting cultural complexes including the full artifact assemblage and information on settlement, subsistence, social and political organization, and economic and technological systems.

Protohistoric and historic contexts that incorporate the historic archaeological resources of the state will be discussed in the next update to the HCHARSD.

Current State Of Context Development

The only contexts to have been systematically updated since the first draft of the State Plan (Buechler 1984a) are those dealing with the Paleoindian period. Information relating to other contexts has been reorganized into the present format and a list of sites pertaining to the context has been provided. The site lists are drawn primarily from the State Archaeological Database Files, maintained by the South Dakota State Archaeological Research Center. These files provide information set forth on the site forms submitted by researchers. This information cannot be considered complete or entirely reliable at this time, but it does provide a baseline for further investigating these contexts. In many cases no information at all is presented for the contexts and subcontexts. This does not mean no information exists; funding simply has not been provided to more completely develop these contexts.

The distribution maps provided for each context show **only** the archaeological regions related to the sites listed for each context.

Contexts, Archaeological Regions And Regional Research Topics

The two major sections of this document are those dealing with the historic contexts and the archaeological regions. As explained above, both are intrinsically interrelated and in several ways share the same information. The link between contexts and archaeological regions is provided, in this document, by the map of archaeological regions presented at the end of each context. This map graphically displays the regions in which historic properties of that context are known to exist, are expected, or have minimal or unknown potential to exist.

The topic of research questions also cross-cuts contexts and archaeological regions. In the next section, a series of statewide research topics that generally apply to several contexts and within several archaeological regions are presented. In addition, questions of a more theoretical and procedural nature, relating more closely to the discipline of archaeology are included.

SECTION 9 - STATEWIDE RESEARCH TOPICS

In the case of each research question posed, researchers must ask how the data set in South Dakota is particularly suited to addressing the specific research question, beyond the obvious regional concerns. The South Dakota data may offer insights into a critical period of culture change or be the specific location of cultural interaction or a site may offer exceptional integrity or possess an important stratigraphic sequence.

A. **Processual Questions** (examining the lifeways of prehistoric and historic populations in South Dakota)

1. Subsistence strategies.

[Questions from Black Hills National Forest solicitation No. R2-03-90-12]

a: Do dry (i.e., no permanent water) campsites indicate limited time and cultural activities?

b: Was eagle trapping practiced in the Black Hills? What are the expected attributes for such sites in the archaeological record?

c: Within the Black Hills, was the cambium of trees (i.e., yellow pine, lodgepole pine, white aspen, and cottonwood) harvested? To what extent, for what purposes, and what are the physical remains?

d: For a given study area, how extensive were trading areas during different time periods?

2. Technology.

[Question from Black Hills National Forest solicitation No. R2-03-90-12]

a: Did tools become more specialized through time or were they generally multipurpose? What economic, social or spiritual considerations have affected this?

3. Chronology/temporal variation.

[Question (a) from Black Hills National Forest solicitation No. R2-03-90-12]

a: Refinement of projectile point time chronologies.

b: Development of new dating methods.

c: Development of models of interaction between contemporaneous ethnic groups.

4. Social interaction/organization.
[Questions from Black Hills National Forest solicitation No. R2-03-90-12]
 - a: In a given study area, did the social organization systems grow or otherwise change through time? If so, was this brought about by internal or external factors?
 - b: Did task specific specialization develop and if so, in what tasks or functions?
 - c: What systems acted to maintain balance between the competitive forces for the preservation of the individual and/or group?
5. Trade networks.
6. Territoriality.
7. Settlement patterns.
[Questions from Black Hills National Forest solicitation No. R2-03-90-12].
 - a: Can seasonal use patterns be identified through time in a given study area, and if so, what are they and how do they change?
 - b: Does a basic patterning in site location and function exist and can it be identified?
 - c: Is site location a key to seasonality?
 - d: For a given study area, can any prehistoric/protohistoric trail systems be identified? What are their attributes, locations, and how can they be found?
 - e: Do patterns of settlement size/type/location support networks of political organization?
8. Site distribution.
9. Cultural change and transition - especially cultural dynamics of transitional periods, e.g., Clovis to Folsom and Folsom to Plano.
10. Range of variability.
11. Demography-mortality.
[Questions from Black Hills National Forest solicitation No. R2-03-90-12]
 - a: For a given study area, what were the relative populations in each temporal period and how were they distributed?
 - b: What factors limited or otherwise controlled population through time?
12. Political, social and ideological structures. Ethnographic work in tribal societies demonstrates that how political, social and ideological structures function within the economy has a great deal to do with the trajectory of the culture (e.g., expansion, contraction, stability, upheaval, etc.). Furthermore, as this argument applies to Late Prehistoric societies, it must also be applied to Archaic and Woodland manifestations (Benn 1986:33).

13. What were the population dynamics of the South Dakota tribes over time?
14. What impact did disease have on the cultural development of South Dakota tribes?
15. Is there evidence to support unrecorded explorations in the Black Hills before Lewis and Clark?

B. Environmental Studies

1. Paleoenvironmental reconstruction, especially where deep deposits exist, as in the Badlands, the Sandhills, the Missouri River terraces and Holocene loess-covered uplands.
2. Pleistocene extinction questions.
3. Potential for relict late Pleistocene resources. The badlands provide a good environment for preservation of data relating to these issues.
4. Altithermal and the impact of environment on cultural systems. The Black Hills has been proposed as a refugium during this period.
5. Effect of environmental factors such as soil, sandstone outcrops, and lithic resources on site distribution models.
6. Potential impact of environment on subsistence, technology, etc.
7. Potential for the development of dendrochronological sequences, geomorphological dating, microfaunal analyses, etc.
8. Lithic procurement.

C. Taxonomic Review/Revision

1. Examine taxonomic systems to determine if they are adequate.
2. Redefine Middle Plains Archaic, especially in eastern South Dakota. Is it a local development?
3. Are Woodland populations adapting to Archaic influences, or are Archaic populations adapting to Woodland influences, or both? Can these questions be determined archaeologically?
4. Are Besant and Pelican Lake contemporary or sequential?
5. Redefinition of Woodland/Sonota relationships.
6. Do Terminal Middle Missouri sites exist in South Dakota?
7. Is the taxonomic structure adequate to respond to cultural transition (i.e., Initial Middle Missouri to Extended Middle Missouri, relationships between Late Woodland/Great Oasis/Initial Middle Missouri, etc.)?

D. Miscellaneous

1. Provisions for the completion of descriptive analyses of excavated, but unpublished, materials.
2. Compilation of reliable comparative collections.
3. Quantification of diagnostic indicators such as projectile point style, ceramic variability, etc.
4. Skeletal biological research is viewed as a contribution to the resource base of the state. Research problems to which this material is directly relevant include:
 - Subsistence patterns.* What was the level of dependence upon maize during the Woodland period? Do Great Oasis skeletons, as compared to the earlier Woodland samples, reflect the addition of a substantial maize component?
 - Spatial and temporal variation in cranial and postcranial morphology* provides information concerned with human adaptation and environmental response. Key questions concern population movement as a factor in postcranial variation, and reduction in size and skeletal mass as a consequence of transition from preagriculture to agriculture.
 - Regional and temporal patterning in skeletal pathology.*
 - Mortuary practices* (e.g., Lehmer's [1971:70] statement that "burial customs are not known for any of the Middle Missouri variants" is still true).
5. Pursuit of ethnohistoric research is encouraged.
6. Non-site loci.
 - [Questions from Black Hills National Forest solicitation No. R2-03-90-12].
 - a: Are isolated finds clustered around campsites or other site types?
 - b: Do small lithic scatters represent resource procurement locations or reduction areas?
 - c: Do different isolate types (i.e., points, flakes, scrapers, etc.) occur in different environmental zones or topographic settings?
 - d: To what extent can specific isolated finds be related to specific locations? How do the activities carried out at each relate?
 - e: Does the distribution of isolated projectile points change through time and does this reflect changes in procurement strategies and/or land use patterns?
7. Expand use of Geographic Information Systems.
8. Expand use of remote sensing techniques.

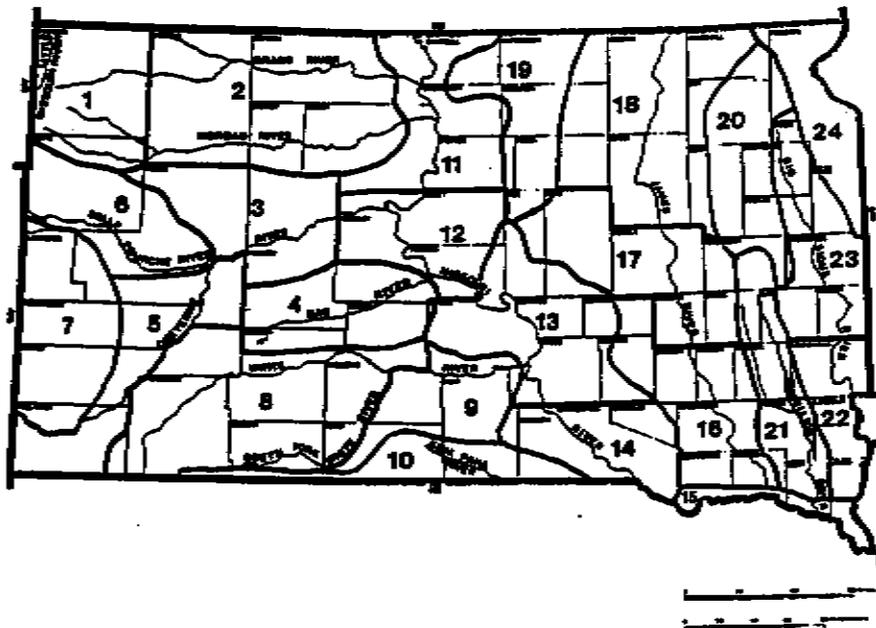

Figure 10.1. South Dakota archaeological regions.

CONTEXTS AND SUBCONTEXTS OUTLINE

The following topics may be addressed for each context and subcontext:

Temporal boundaries	Goals and priorities
Spatial boundaries	Identification
Property types	Evaluation
Locational characteristics	Registration
Context definition	Documentation
Surveys	Treatment
Condition	National Register listings
Voids in research	Sites (when applicable)
Research questions	Absolute dates (when relevant)
	Bibliography
	Map of archaeological regions showing known sites and potential for sites (see above)

An introduction to the major cultural/temporal contexts will include a listing of contexts, an overview statement, and a discussion of the environmental setting, and will address in broad terms the above context-specific topics.

PALEOINDIAN CONTEXTS AN INTRODUCTION

CONTEXTS: Nine contexts and subcontexts are outlined for the Paleoindian period: **pre-Clovis, Clovis, Goshen, Folsom, Midland, Plainview, Early Plano** [Agate Basin, Hell Gap, Alberta, Cody, Angostura], **Late Plano** [Fredrick, James Allen, Eden, Scottsbluff, Lusk, Milnesand], and **Unassigned Paleoindian**.

OVERVIEW: Recent investigations suggest to some researchers that humans entered the New World over 30,000 years ago (Bonnichsen et al. 1987), and that there are archaeological cultures that predate Clovis. However, Clovis and Folsom remain the earliest well-defined archaeological cultures in North America. Both technocomplexes are characterized by the presence of lanceolate spearpoints with a distinctive flake (flute) removed from the proximal base of the projectile. All other cultural technocomplexes of the Paleoindian period are characterized by unfluted lanceolate projectile points. The Paleoindian tradition is characterized as an adaptation to the hunting of late Pleistocene megafauna, principally the now-extinct species of bison and mammoth.

ENVIRONMENTAL SETTING: The North American ice sheets reached their maximum extent in the south generally at about 20 to 21 ka, and a fluctuating retreat began soon thereafter (Wright 1987:479). The Paleoindian contexts fall primarily within the pre-Boreal, Boreal and Atlantic periods.

TEMPORAL BOUNDARIES: Pre-7500 B.P.

SPATIAL BOUNDARIES: Entire state.

PROPERTY TYPES: Kill sites, butchery sites, open campsites, hearths, food-processing areas, chipping stations, quarry sites, isolated finds.

LOCATIONAL CHARACTERISTICS: Activity-related, often by water source.

CONTEXT DEFINITIONS: Most sites are assigned to these contexts on the basis of diagnostic artifacts, usually projectile points. Some sites may be assigned to this context on the basis of stratigraphy and/or absolute dating (radiocarbon).

SURVEYS: Few surveys have been conducted with the express goal of locating Paleoindian sites.

CONDITION: While surface-collected materials of these contexts exist, few sites possessing integrity have been documented. Such sites are likely to be deeply-buried, and there is a need to be aware that in certain areas of the state surface inspection alone is not sufficient to evaluate the potential for sites belonging to this context.

VOIDS IN RESEARCH: There has been no systematic attempt to locate Paleoindian sites. There is a need to identify areas with a high potential for buried Paleoindian sites, and to establish procedures to evaluate/investigate that potential. Very few sites have provided in situ materials and there is a lack of radiocarbon dates. Geomorphological research is essential for clarification of high potential site areas.

RESEARCH QUESTIONS: Archaeological regions which appear to offer the greatest potential for Paleoindian research at this time include the South Fork Cheyenne, Black Hills, White River Badlands and Grand-Moreau regions.

1. Resolution of typological questions about the relationship of Paleoindian sites to other sites in the northwestern Plains.
2. Evaluation of the potential for deeply-buried Paleoindian sites (e.g., Agate Basin site and the Danks site).
3. Environmental studies that address Paleoindian utilization of the area. What were the contemporary landscapes and vegetation communities?
4. Basic definition of culture complexes and associations.
5. Address issues of geographic, temporal and functional variations of point types.
6. Address the Folsom-Midland problem. Is there a true Midland complex?
7. What is the nature of fluted points that are difficult to label as either Clovis or Folsom?
8. What are the salient differences between Paleoindian and Early/Middle Archaic peoples?
9. Was the economy of the Paleoindians bison-dominated? If so, when and where? If so, did the bison-dominated economy of Paleoindians change to reliance on a wider mixture of resources, and, if so, when and why?

GOALS AND PRIORITIES: No priorities have yet been set for any goals.

Identification. Goals: i) to identify through geomorphological studies and surveys, all areas of the state where intact deposits of the Paleoindian period might be present; ii) to test excavate or otherwise evaluate selected (sample) areas to determine if buried Paleoindian sites are present; iii) to monitor all subsurface-disturbing projects that have the potential to impact Paleoindian sites.

Evaluation. Many Paleoindian sites reflect the earliest known peopling of the New World and can be evaluated under criterion (a) in that this (the peopling of the New World) is a significant pattern in America's history. Under criterion (d) even surface sites might be considered significant at this time because so few sites of this period have been studied in detail. All Paleoindian sites possessing integrity are considered significant at this time. Site significance increases as site integrity increases and in relation to the diversity of materials present and length of occupation.

Goals: i) to develop context-specific evaluation criteria.

Registration. Goals: i) to nominate to the National Register all eligible Paleoindian sites.

Documentation. Goals: i) to fully document (map, survey, test) all Paleoindian sites; ii) to adequately mitigate all Paleoindian sites that cannot be protected/preserved.

Treatment. Goals: i) to preserve a representative sample of Paleoindian sites in South Dakota.

NATIONAL REGISTER LISTINGS: None.

SITES CLASSIFIED AS 'LATE PALEOINDIAN' OR 'PALEOINDIAN':

Late Paleoindian [Regions 2, 5, 8, 23]:

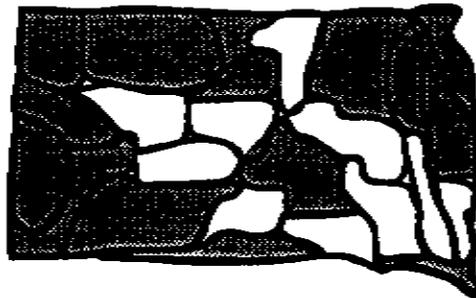

39BK19	39DW148	39FA1074	39PE11	39SH80	39WW49
--------	---------	----------	--------	--------	--------

Paleoindian [Regions 1, 2, 7, 8, 15, 18, 24]:

39BN65	39BO51	39BU167	39CO113	39CU12	39CU773
39CU774	39DE5	39DW118	39FA833	39HN373	39LA510
39LA537	39PN5	39PN340	39PN795	39SH15	39SH37

BIBLIOGRAPHY: See specific contexts.

ARCHAEOLOGICAL REGIONS - ALL PALEOINDIAN

PRE-CLOVIS

TEMPORAL BOUNDARIES: ca. pre-12,000 B.P.

SPATIAL BOUNDARIES: No sites assignable to this context are currently known in the state. The potential for the presence of this context exists in all archaeological regions; however, it will only be observable in regions not affected by glacial advances.

PROPERTY TYPES: None known. Expect open campsites, hearths, food-processing areas, kill sites.

LOCATIONAL CHARACTERISTICS: Unknown. Should consist of evidence for human activity in association with Late Pleistocene fauna and/or flora in a stratigraphic context of late glacial-age sediments. Evidence of human activity may be flake or chopper lithic industries rather than lanceolate points, and bone or wooden tools in association with butchered animals (Benn 1986:24).

CONTEXT DEFINITION: Sites classified under this context would be stratigraphically earlier than Clovis complex occupations.

SURVEYS: None.

CONDITION: Unknown.

VOIDS IN RESEARCH: No pre-Clovis sites currently identified.

RESEARCH QUESTIONS:

1. In what areas of the state are pre-12,000 B.P. landforms exposed, buried, or destroyed?

GOALS AND PRIORITIES: See Paleoindian introduction.

Evaluation. All sites would be important because, while suspected, no evidence of pre-Clovis occupation has been substantiated.

NATIONAL REGISTER LISTINGS: None.

BIBLIOGRAPHY: Nowak, Hannus and Lueck 1982.

CLOVIS

TEMPORAL BOUNDARIES: 11,500 B.P.-11,000 B.P.

SPATIAL BOUNDARIES: Surface finds reported from across the state. Major excavation of the Lange/Ferguson mammoth kill/butchery site in the White River Badlands Region. Most reported Clovis finds from western South Dakota.

PROPERTY TYPES: Open campsites, hearths, food processing areas, kill sites, butchery sites, quarry sites, isolated finds.

LOCATIONAL CHARACTERISTICS: Insufficient data for patterns to emerge.

CONTEXT DEFINITION: Sites which contain Clovis fluted points. The points are lanceolate in shape and the flute is typically removed on both sides of the point and extends halfway to three-quarters of the way up the length of the point, with the base and lower portions of the point ground. Clovis peoples were hunter-gatherers who emphasized the hunting of large herd animals (all now extinct).

SURVEYS: See Paleoindian introduction.

CONDITION: See Paleoindian introduction.

VOIDS IN RESEARCH: See Paleoindian introduction.

RESEARCH QUESTIONS:

1. Defining the range of variation of Clovis points.
2. Identifying tool types typical of Clovis assemblages (other than Clovis projectile points).
3. Defining Clovis social organization and population size.

GOALS AND PRIORITIES: See Paleoindian introduction.

NATIONAL REGISTER LISTINGS: None.

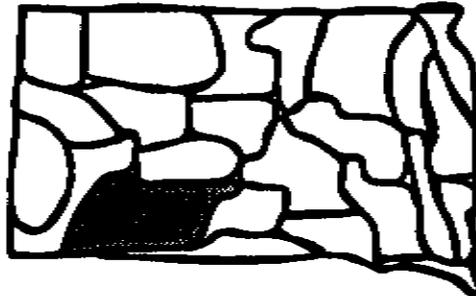

CLOVIS SITES (REGION 8):

39SH33	39SH37
--------	--------

ABSOLUTE DATES: 39SH33 - 10,670±300 B.P.; 10,730±530 B.P.

BIBLIOGRAPHY: Hannus 1980, 1981, 1982, 1985, 1986a, 1988, 1990a, 1990b; Haynes 1982.

ARCHAEOLOGICAL REGIONS-CLOVIS

GOSHEN

TEMPORAL BOUNDARIES: 11,340 B.P.-10,760 B.P.

SPATIAL BOUNDARIES: Southwestern South Dakota.

PROPERTY TYPES: Bison kill. Potential for wider range of types similar to other Paleoindian contexts.

LOCATIONAL CHARACTERISTICS: Insufficient data at this time.

CONTEXT DEFINITION: Projectile points that appear to fit between Clovis and Folsom have been reported from Wyoming (Frison 1978:23) and in other areas. An evaluation by Hannus and Nowak of projectile points recovered in the White River Badlands Region suggests that some of the specimens may be assigned to the position typologically between Clovis and Folsom (Hannus, personal communication 1989). More recently, Frison has established Goshen as a viable cultural position between Clovis and Folsom. Work at the Mill Iron site (24CT30), located in Montana, not far from the South Dakota border, produced unfluted Goshen points, dated to late or terminal Clovis [11,340±120 B.P.] (Dolzani 1986:8). This context includes sites associated with Goshen points.

SURVEYS: None.

CONDITION: Unknown.

VOIDS IN RESEARCH: See Paleoindian introduction.

RESEARCH QUESTIONS:

1. Can Goshen be formally identified in South Dakota?
2. What is the nature of the Clovis-Folsom transition, especially with regard to social organization, settlement pattern, and cultural heterogeneity?

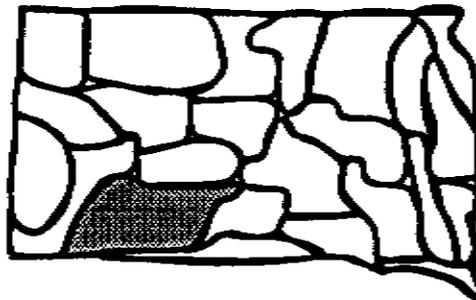

GOALS AND PRIORITIES: See Paleoindian introduction.

NATIONAL REGISTER LISTINGS: None.

SITES: Goshen-like points are represented in specimens from the White River Badlands Region (REGION 8) collected by Les Ferguson (Hannus, personal communication 1989).

BIBLIOGRAPHY: Deaver and Deaver 1988; Dolzani 1986.

ARCHAEOLOGICAL REGIONS-GOSHEN

FOLSOM

TEMPORAL BOUNDARIES: 11,000 B.P.-10,500 B.P.

SPATIAL BOUNDARIES: Entire state.

PROPERTY TYPES: Bison kill. Potential for wider range of types similar to other Paleoindian contexts.

LOCATIONAL CHARACTERISTICS: Insufficient data at this time.

CONTEXT DEFINITION: Sites containing Folsom points. Folsom points are medium-sized, fluted lanceolate points with parallel to convex sides. They are widest at or above the midsection and exhibit a broad, snub-nosed tip. Bases are concave with slightly rounded or pointed basal ears (Morrow 1984:14).

SURVEYS: None.

CONDITION: Unknown.

VOIDS IN RESEARCH: See Paleoindian introduction

RESEARCH QUESTIONS:

1. What is the nature of the Folsom-Piano transition, especially with regard to social organization, settlement pattern, and cultural heterogeneity?

GOALS AND PRIORITIES: See Paleoindian introduction.

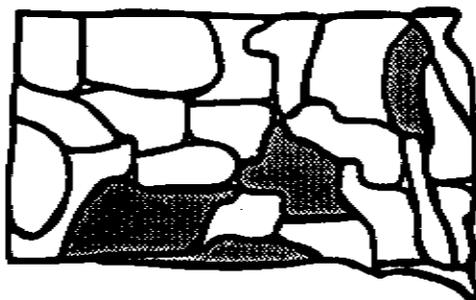

NATIONAL REGISTER LISTINGS: None.

FOLSOM SITES (REGIONS 8, 10, 13, 20):

39CK2	39GR30	39GR31	39HE6	39HU78	39SH101
39TP1	39TP2	39TP3			

BIBLIOGRAPHY: Frison and Bradley 1980; Frison and Stanford 1982; Hannus and Winham 1985; Haynes 1982.

ARCHAEOLOGICAL REGIONS-FOLSOM

MIDLAND

TEMPORAL BOUNDARIES: 11,000 B.P.-10,500 B.P.

SPATIAL BOUNDARIES: Southwestern South Dakota.

PROPERTY TYPES: Bison kill. Potential for wider range of types similar to other Paleoindian contexts.

LOCATIONAL CHARACTERISTICS: Insufficient data at this time.

CONTEXT DEFINITION: Midland-like points are represented in specimens from the White River Badlands Region collected by Les Ferguson (Hannus, personal communication 1989). These specimens are unfluted.

SURVEYS: None.

CONDITION: Unknown.

VOIDS IN RESEARCH: See Paleoindian introduction.

RESEARCH QUESTIONS:

1. Is Midland a distinct complex?

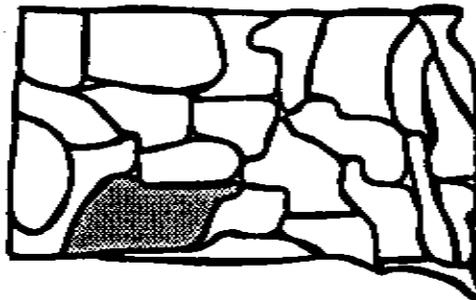

GOALS AND PRIORITIES: See Paleoindian introduction.

NATIONAL REGISTER LISTINGS: None.

SITES: Reported surface finds only [REGION 8].

BIBLIOGRAPHY: Frison 1978.

ARCHAEOLOGICAL REGIONS-MIDLAND

PLAINVIEW

TEMPORAL BOUNDARIES: 11,000 B.P.-10,500 B.P.

SPATIAL BOUNDARIES: Southwestern South Dakota.

PROPERTY TYPES: Bison kill. Potential for wider range of types similar to other Paleoindian contexts.

LOCATIONAL CHARACTERISTICS: Insufficient data at this time.

CONTEXT DEFINITION: A number of authors, including Dibble and Lorrain (1968), Wheat (1972), and Irwin-Williams et al. (1973), have suggested that the unfluted Plainview point type may mark a transition from Folsom into the long sequence of unfluted point types that continue.

Plainview points are medium-sized lanceolate points with essentially parallel sides and a concave base. Blade surfaces generally exhibit horizontal and parallel pressure flaking scars. Two or three thinning flakes have usually been drawn from the basal concavity. Grinding of the lateral and basal edges is common. They range in length from 6-9 cm and are fairly thin in cross section (Morrow 1984:15).

SURVEYS: None.

CONDITION: Unknown.

VOIDS IN RESEARCH: See Paleoindian introduction.

RESEARCH QUESTIONS:

1. To define the presence of Plainview-associated sites in South Dakota.

GOALS AND PRIORITIES: See Paleoindian introduction.

NATIONAL REGISTER LISTINGS: None.

PLAINVIEW SITES [REGIONS 7, 8]:

39PN5 (Jay Hamm)

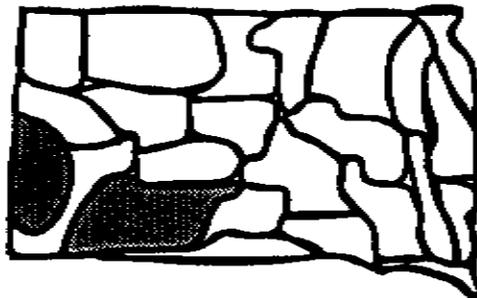

This site is identified as a lanceolate projectile point which was found at the foot of a dam in 1953 (Beaubien 1953:5). The find is reported to be "similar to a Plainview type" (Taylor 1961:80).

39CU252 39FA790

Plainview-like points are also represented in specimens from the White River Badlands Region collected by Les Ferguson (Hannus, personal communication 1989).

BIBLIOGRAPHY: Winham, Hannus and Lueck 1989.

ARCHAEOLOGICAL REGIONS-PLAINVIEW

EARLY PLANO

Agate Basin, Hell Gap, Alberta, Cody, Angostura

TEMPORAL BOUNDARIES: 10,500 B.P.-8500 B.P.

SPATIAL BOUNDARIES: Entire state.

PROPERTY TYPES: Bison kill. Potential for wider range of types similar to other Paleoindian contexts.

LOCATIONAL CHARACTERISTICS: Insufficient data at this time.

CONTEXT DEFINITION: Sites containing large, lanceolate, and basally constricted and rounded types (Hell Gap/Agate Basin), and/or large, lanceolate forms with distinct stems (Alberta/Cody). Most bases and stems are ground.

Technocomplexes known as Plano appear contemporaneously with Folsom and evolve over the next several millennia across the Plains of North America. Plano period sites are recognized by the various parallel-oblique flaked, lanceolate, unfluted projectile point types that emerge. A number of point types have been named and placed into two broad

temporal groups, an early group (Agate Basin, Heli Gap, Alberta, Cody, Angostura) and a later group (Fredrick, James Allen, Eden, Scottsbluff, Milnesand).

SURVEYS: None.

CONDITION: Unknown.

VOIDS IN RESEARCH: See Paleoindian introduction.

RESEARCH QUESTIONS: See Paleoindian introduction. Also:

1. Should Angostura be considered a "type" or should it be subsumed under the Agate Basin complex of projectile points?
2. What does the heterogeneity of the artifacts mean in terms of cultural heterogeneity? Are the various point types contemporaneous or not in any given area?

GOALS AND PRIORITIES: See Paleoindian introduction.

NATIONAL REGISTER LISTINGS: None.

EARLY PLANO SITES:

AGATE BASIN SITES (REGIONS 7, 8):

39CU989	39FA423	39PN751
39SH96 (Ten Fingers)	39SH100 (West Harney)	39SH129
39SH132		

ALBERTA SITES (REGIONS 8, 24):

39DE9	39SH85
-------	--------

ANGOSTURA SITES (REGIONS 6, 7, 15):

39BU69	39BU107	39CU811	39CL7	39FA65	39LA3
--------	---------	---------	-------	--------	-------

UNASSIGNED EARLY PLANO SITES (REGION 11):

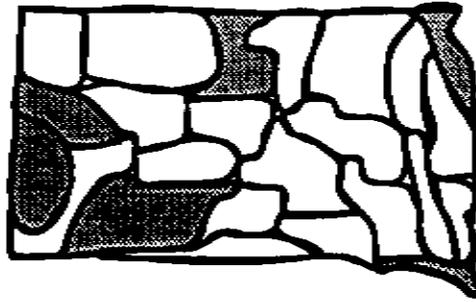

39WW15 (Travis II).

All early Plano point types are represented in collections made from the White River Badlands Region by Les Ferguson (Hannus, personal communication 1989).

ABSOLUTE DATES: 39FA65 (Ray Long-Angostura) - 7430±500 B.C.

BIBLIOGRAPHY: Hannus 1986b; Winham, Hannus and Lueck 1989.

ARCHAEOLOGICAL REGIONS-EARLY PLANO

LATE PLANO

Fredrick, James Allen, Eden, Scottsbluff, Milnesand, Lusk

TEMPORAL BOUNDARIES: 8500 B.P.-7500 B.P.

SPATIAL BOUNDARIES: Entire state.

PROPERTY TYPES: Bison kill. Potential for wider range of types similar to other Paleoindian contexts.

LOCATIONAL CHARACTERISTICS: Insufficient data at this time.

CONTEXT DEFINITION: Sites with large, lanceolate projectile points exhibiting well-executed parallel flaking. Bases are usually straight to shallowly concave and most types have relatively straight lateral edges (e.g., Fredrick, James Allen, Eden, Scottsbluff, Milnesand).

Technocomplexes known as Plano appear contemporaneously with Folsom and evolve over the next several millennia across the Plains of North America. Plano period sites are recognized by the various parallel-oblique flaked, lanceolate, unfluted projectile point types that emerge. A number of point types have been named and placed into two broad temporal groups, an early group (Agate Basin, Hell Gap, Alberta, Cody, Angostura) and a later group (Fredrick, James Allen, Eden, Scottsbluff, Milnesand).

SURVEYS: None.

CONDITION: Unknown.

VOIDS IN RESEARCH: Very limited data on dates associated with Plano point types. Very limited data on adaptations and relationships of groups utilizing Plano point types. Very limited data from excavated sites/in situ contexts.

RESEARCH QUESTIONS:

1. Define the relationship between the Travis II lanceolate projectile points (Agate Basin/Angostura-like) and other similar points from South Dakota.
2. What does the heterogeneity of the artifacts mean in terms of cultural heterogeneity? Are the various point types contemporaneous or not in any given area?

GOALS AND PRIORITIES: See Paleoindian introduction.

NATIONAL REGISTER LISTINGS: None.

ARCHEOLOGICAL REGIONS - ALL PLANO SITES

EARLY ARCHAIC CONTEXTS

AN INTRODUCTION

CONTEXTS: Five contexts and subcontexts are outlined for the Early Archaic period: Hawken, Logan Creek complex (subcontexts: Simonsen and Delong), and Unassigned Early Archaic.

OVERVIEW: There is very little information for this period in South Dakota. More arid climatic conditions prevailed (Altitheamal) and "the Archaic tradition is seen as a nomadic, broad spectrum foraging adaptation to the Plains (i.e., generalized hunting and gathering), believed to be a readjustment of Paleoindian lifeways to a changing Plains environment as the Pleistocene gave way to the Holocene. The extinction of many species of Pleistocene megafauna was of particular importance, requiring an apparently radical shift in subsistence practices" (Ahler and Toom 1989:29).

In areas adjacent to South Dakota, sites of this period have produced a wide range of point styles, some of which can easily be mistaken for later types, such as Pelican Lake or Besant.

ENVIRONMENTAL SETTING: Altitheamal.

TEMPORAL BOUNDARIES: 8000 B.P.-7000 B.P.

SPATIAL BOUNDARIES: Entire state.

PROPERTY TYPES: Short-term camps, bison kills, burials, stone circles(?).

LOCATIONAL CHARACTERISTICS: Insufficient data.

CONTEXT DEFINITION: Based on temporal/stratigraphic or diagnostic evidence. A variety of notched and stemmed point styles are present in the Early Archaic period.

SURVEYS: None - basic lack of systematic investigation for sites of this period, which are likely to be deeply-buried in areas such as the Missouri River valley.

CONDITION: Unknown.

VOIDS IN RESEARCH: There are too few sites and too little variation in the site data to develop reliable generalizations about Early Archaic subsistence and settlement patterns.

RESEARCH QUESTIONS:

1. Are there diagnostic indicators for the Early Plains Archaic other than large, side-notched projectile points?
2. Issues concerning the Altitheamal period. Did the James River dry up during the Altitheamal? What effect did this climatic regime have on faunal and floral populations as well as human groups?
3. Where are the Early Archaic sites along the Missouri River?
4. Just how different was the lifeway of Early Archaic peoples from that of the preceding Paleoindian population? Were the changes in subsistence, in settlement pattern and in population density radical?
5. Reinvestigation of Ludlow Cave and Thomas Creek sites.
6. What is the nature of the Early-Middle Archaic transition, especially with regard to social organization, settlement pattern, and cultural heterogeneity?

7. What is the nature of the Archaic-Late Prehistoric transition, especially with regard to social organization, settlement pattern, and cultural heterogeneity?

GOALS AND PRIORITIES: Systematic investigation for sites of this period.

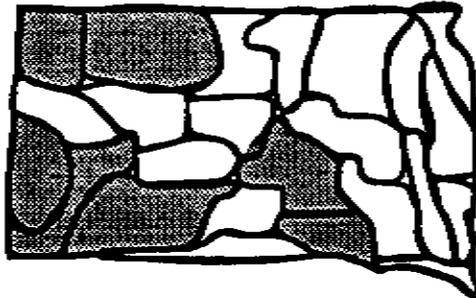

NATIONAL REGISTER LISTINGS: None.

UNASSIGNED EARLY ARCHAIC SITES (REGIONS 1, 2, 5, 7, 8, 13, 14):

ARCHAEOLOGICAL REGIONS-LOGAN CREEK COMPLEX

MIDDLE ARCHAIC CONTEXTS

AN INTRODUCTION

CONTEXTS: Three contexts are outlined for the Middle Archaic period: **Oxbow, McKean/Duncan/Hanna, and Yonkee.**

OVERVIEW: The Middle Plains Archaic period (Frison 1978) or Middle Prehistoric period (Wheeler 1955) is dominated by the distinctive McKean complex - the hallmark of the early Middle Prehistoric period (Mulloy 1958). The focus for McKean studies in South Dakota has been the Black Hills (Tratebas 1986). Duncan and Hanna points are found both mixed with McKean points and as separate (later) components. At this time they are treated as part of the McKean complex. Future research will undoubtedly refine the relationships between assemblages containing these different point types. At the Medicine Crow site complex, stemmed Duncan points are assigned to the Late Archaic in the local sequence (Ahler and Toom 1989:287).

Preceding, and in some areas overlapping McKean, is Oxbow, seen by some researchers as the beginning of a tradition that focused on upland game procurement (Deaver and Deaver 1988:100). The Powers-Yonkee site has recently been redated to 3100 B.P.-2700 B.P. and Yonkee sites appear to date from 3100 B.P.-2500 B.P.

TEMPORAL BOUNDARIES: 7000 B.P.-2500 B.P.

SPATIAL BOUNDARIES: Entire state, particularly western South Dakota.

PROPERTY TYPES: Short-term camps, burials, stone circles, bison kills.

LOCATIONAL CHARACTERISTICS: See specific contexts.

CONTEXT DEFINITION: Based on temporal position, stratigraphy, diagnostic artifacts and assemblages reflecting specific lifeways.

SURVEYS: See specific contexts.

CONDITION: See specific contexts.

VOIDS IN RESEARCH: Need to continue to refine our understanding of the McKean complex but also to systematically address other Middle Archaic manifestations (Oxbow, Yonkee and unnamed post-McKean levels).

RESEARCH QUESTIONS (also see specific contexts):

1. What types of residence structures were being utilized during the Middle Plains Archaic and is a transition to the tepee occurring?
2. What is going on with regard to population density? What supported higher densities, if they really existed (both environmental and cultural factors)?
3. Why are there so many point types? (One can state almost with certainty that distinct groups were occupying the same region by following different subsistence rounds. This topic needs to be explored). What does the heterogeneity of the artifacts mean in terms of cultural heterogeneity? Are the various point types contemporaneous or not in a given area?

GOALS AND PRIORITIES: See specific contexts.

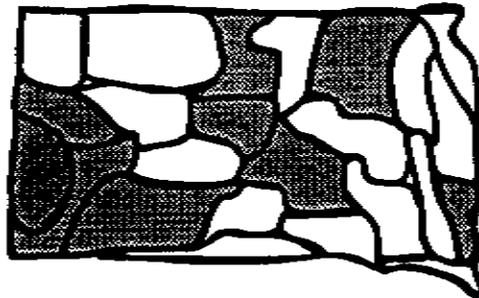

SITES DEFINED AS 'UNASSIGNED MIDDLE ARCHAIC' [REGIONS 5, 6, 7, 8, 11, 12, 13, 18, 22]:

39BF2	39BU134	39BU135	39CU78	39CU144	39CU152

39WW48					

NATIONAL REGISTER LISTINGS: None.

BIBLIOGRAPHY: Ahler and Toom 1989; Kornfeld and Todd 1985.

ARCHAEOLOGICAL REGIONS-MIDDLE ARCHAIC

OXBOW

TEMPORAL BOUNDARIES: 5500 B.P.- 4500 B.P.

SPATIAL BOUNDARIES: Western South Dakota.

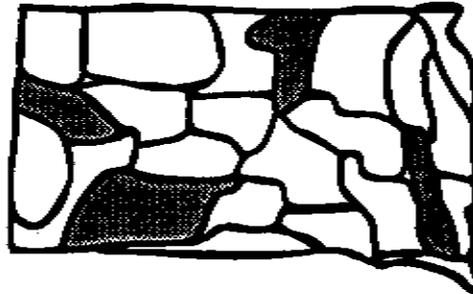

CONTEXT DEFINITION: Sites containing diagnostic artifacts (Oxbow points) and/or a dated assemblage that can be assigned to this context on the basis of other traits (e.g., subsistence based predominantly on upland hunting).

The Oxbow point style is a medium to large side-notched and basally-indented form. The side notches are broad and there is often some rounding below the notch to give almost a corner-notched appearance. The basal indentation is usually very wide and not particularly deep. The points appear to be "eared" as a result of the broad side notches and basal indentations (Deaver and Deaver 1988:100).

OXBOW SITES (REGIONS 6, 8, 19, 21):

39BU64	39BU83	39BU111	39BU203	39LK22?	39MP14
39SH74					

ARCHAEOLOGICAL REGIONS-OXBOW

MCKEAN/DUNCAN/HANNA

TEMPORAL BOUNDARIES: 5000 B.P.-2500 B.P.

SPATIAL BOUNDARIES: Entire state.

PROPERTY TYPES: Short-term, single occupation open camps; long-term, seasonal reuse camps; bison jumps/kills; butchering/processing sites; rock shelters; burials.

RESEARCH QUESTIONS:

Tratebas (1981) and others provide a number of research topics for McKean complex sites, as follows:

1. Better definition of characteristic point styles and explanations why they differ. Do they represent variants of the cultural tradition based upon specific hunting technologies or game species hunted and did they co-exist?
2. Functional analyses to be sure every point style is in fact a projectile and to address differences in hafting technique, shaft size, and so forth.
3. Work on functional analyses and change through time (hindered by insufficient quantities of points from South Dakota).
4. Whether different subsistence patterns reflect portions of a seasonal round, regional differences, or fluctuations in subsistence patterns through time.
5. Tratebas notes that the essential questions about McKean subsistence and settlement patterns have yet to be answered:

What really was the function of the rock-filled fire hearths? Were seeds, nuts or fleshy fruits ground on the metates?

What is the range of plant and animal food utilized and which foods were most preferred?

Why do some sites show intensive utilization of animals, including smashing bones to extract fats, and others show only muscle stripping?

Which foods were preserved for winter?

How long did a group stay in one place?

What was the time interval between occupations?

What exactly constituted the seasonal round?

What was the group size and how did it vary during the seasonal round?

How did climate affect subsistence, the seasonal round, group size, overall population size and so on?

6. A general examination of McKean phase cultural adaptation to the plains/prairie environment.
7. Site distribution and utilization/exploitation of the Black Hills.
8. McKean complex materials may be associated with stone circle sites as was determined by excavations of the Hermosa tipi ring site (Hovde 1980c).

Keyser and Davis (1985), among others, also address the McKean complex and provide future research directions, including:

9. Origins and dispersal. Did the McKean technocomplex develop "in situ" directly from Paleoindian cultural/technological traditions?
10. Chronology.
11. Typology. Understanding the meaning behind the McKean series points and their distribution.
12. Cultural ecology. McKean phase subsistence adaptation and settlement patterns appear markedly diverse but archaeologists have failed to emphasize this diversity.
13. Taxonomy. There is a need for more refined taxonomic units to handle the complexity of this archaeological phenomenon.

Haug (personal communication, 1989) adds the following questions.

14. Is the McKean complex representative of a grouping of projectile point styles constituting a technological horizon, or can it be demonstrated that the complex represents cultural patterning at the phase or tradition level?
15. Are McKean residence sites targeted at high and low discharge springs and is there any difference in these residence types (see Tratebas 1986)?

Sundstrom poses the following question:

16. Why is there so much McKean material in the Black Hills? What is going on with regard to population density?

MCKEAN/DUNCAN/HANNA SITES:

MCKEAN SITES (REGIONS 1, 5, 6, 7, 8, 11, 19):

ARCHAEOLOGICAL REGIONS-LATE ARCHAIC

PELICAN LAKE

RESEARCH QUESTIONS:

Keyser and Davis (1985) discuss the Pelican Lake phase and present a number of research topics, including:

1. The crux of the Pelican Lake "problem" is the familiar issue of whether Pelican Lake denotes a particular technological complex shared by prehistoric Northwestern Plains groups, or instead, is only a broad horizon style temporally relating otherwise distinctive cultural complexes.
2. Chronology and origins. Reeves (1970) derives Pelican Lake from McKean as sequent manifestations of his Tunaxa tradition, but several lines of evidence suggest that the relationship (if any) between McKean and Pelican Lake is more complex than simple unilineal descent. To date no stratigraphic sequence directly associates McKean and early Pelican Lake. Economic distinctions between McKean and Pelican Lake imply significant differences in their cultural-ecological adaptations. Any convincing proposal that these entities are sequentially related cultural

developments must explain the causal mechanism(s) responsible for this shift in economic orientation.

3. **Typology.** No well-defined Pelican Lake projectile point type or series is consistently used throughout the region. Instead, a wide variety of dissimilar corner-notched, corner-removed, and stemmed points have been classified as Pelican Lake. Pelican Lake points show a great range of variation in all aspects of technology and morphology which contrasts with the typological homogeneity of the McKean complex point forms. This suggests the possibility that a marked fragmentation of Northwestern Plains cultures may have occurred during the Pelican Lake phase, resulting in a regional population composed of numerous distinct subunits (local culture groups) similar to the situation that existed on the Plains at the time of historic contact.
4. Concurrent with an effort to define a Pelican Lake projectile point type, archaeologists should focus on describing and defining the complete Pelican Lake cultural assemblage.
5. **Cultural ecology.** If Pelican Lake actually represents an increased emphasis on bison hunting when compared to the preceding McKean complex, the causal mechanism(s) for this shift is not yet known. Possibilities include climatic amelioration with an attendant increase in bison populations, improved technology, a cultural commitment to specialize in bison procurement, or any combination of these or other factors. Answers to these questions await detailed cultural-ecological studies to determine seasonal rounds and settlement patterns of Pelican Lake groups.

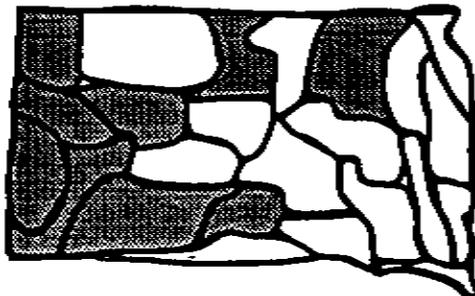

Additional topics include:

6. Are ceramics associated with Pelican Lake?
7. Quantitative projectile point analysis directed toward the differentiation between Late Archaic and Middle to Late Woodland populations.

ARCHAEOLOGICAL REGIONS-PELICAN LAKE

LATE PREHISTORIC CONTEXTS

AN INTRODUCTION

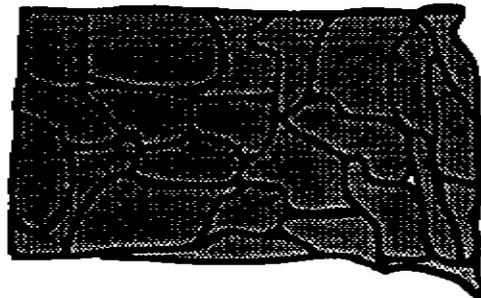

CONTEXTS: Three contexts are outlined for the Late Prehistoric period: **Avonlea, Old Women's phase and Nomadic Northern Plains Bison-Hunting Groups.**

RESEARCH QUESTIONS:

Keyser and Davis (1985) provide a discussion of research directions for the Late Prehistoric period in western North and South Dakota. Some of the topics they addressed (applicable particularly to archaeological regions 1-8) include:

1. Documenting the nature and extent of the relationship between the Missouri River villagers and the Northern Plains bison hunters.
2. Defining cultural complexes.
3. Determining which Late Prehistoric period groups of nomadic bison hunters used this area and then defining their characteristic archaeological assemblages. Ethnographic and ethnohistoric evidence suggests that the area between the Missouri and Yellowstone rivers was used regularly by members of at least nine different ethnic groups (Athapaskans, Shoshone, Crow, Kiowa, Atsina, Cree, Assiniboine, Sioux, and Cheyenne) during the Late Prehistoric and Protohistoric periods, but for the most part these groups are archaeologically similar. However, a growing number of sites with ceramics of the Powder River tradition indicate occupation by the Crow or their forebears, and a very few sites in the area have yielded Intermountain tradition pottery or steatite vessels that indicate Shoshone occupation. Additionally, analysis of the characteristic Late Prehistoric period side-notched projectile point varieties suggests that different forms may indicate cultural and chronological distinctions.
4. Defining cultural ecological adaptations of the respective peoples - settlement patterns through time for different individual groups are poorly known. For instance, no one has differentiated the settlement patterns characteristic of the Middle Missouri and Coalescent traditions on the open plains away from the Missouri River.
5. Determining the nature of the Late Prehistoric-Equestrian transition, especially with regard to social organization, settlement pattern, and cultural heterogeneity.

OLD WOMEN'S PHASE

NOMADIC NORTHERN PLAINS BISON-HUNTING GROUPS

WOODLAND CONTEXTS

AN INTRODUCTION

CONTEXTS: Twelve contexts and subcontexts are outlined for the Woodland period: **Middle Woodland**, which includes the **Fox Lake phase**, **Besant**, **Sonota complex**, **Valley phase** and **Unassigned Middle Woodland**; **Late Woodland**, which includes the **Loseke Creek phase**, **Lake Benton phase** and **Unassigned Late Woodland**; the **Arvilla complex**; and **Great Oasis**.

SPATIAL BOUNDARIES: Entire state, particularly eastern South Dakota.

RESEARCH QUESTIONS:

1. Taxonomic and typological problems.
2. A geomorphological approach to site location may be critical for the identification of Woodland habitation sites that may be correlated with mound groups. The relationships of these living areas to burial complexes will provide a comprehensive interpretation of Woodland populations, particularly within the Big Bend Region.
3. An examination of the relationships with northeastern Woodland populations. Are the Woodland resources of the Coteau des Prairies a unique adaptation?

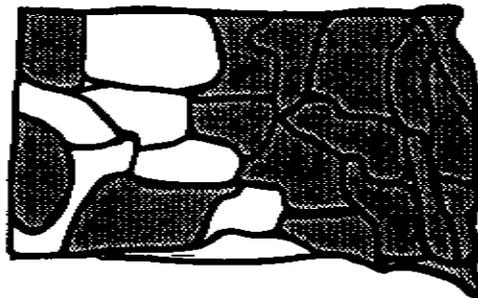

4. What are the subsistence strategies of the Coteau Woodland populations? Are they Woodland bison hunters, adapted to prairie lake exploitation, or both? Examining single component sites in the Prairie Coteau Region is important because most sites in that region contain multiple components without stratigraphic separation.
5. Document the change from Archaic to Woodland patterns. What do we mean by Woodland? Is the introduction of ceramics definitely a marker of culture change?
6. What was the input of northern Woodland tradition through the Prairie pothole region?
7. What are the changing mortuary practices?
8. Define the phase distinctions for Woodland.
9. What is the relationship between Woodland and Great Oasis?
10. What were the processes by which economies evolved from an Archaic hunting and gathering base to a horticultural-foraging system (Benn 1986:28)?
11. What historical processes led some societies to develop more elaborate "villager" patterns than others (Benn 1986:28-29)?

UNASSIGNED "WOODLAND/PLAINS WOODLAND" SITES [REGIONS 1, 7, 8, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24]:

ARCHAEOLOGICAL REGIONS-WOODLAND

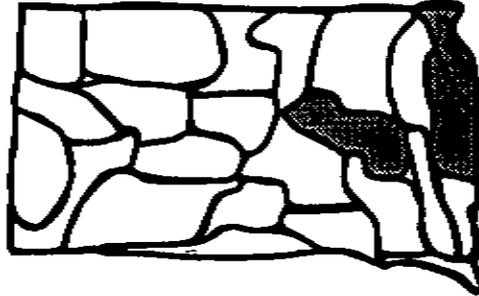

MIDDLE WOODLAND

UNASSIGNED 'MIDDLE WOODLAND' SITES (REGIONS 17, 23, 24):

39BE23	39BE25	39BE27	39BE29	39BE46	39BE48
39BE54	39BE55	39BE57	39BE62	39BE64	39BK7
39DE5					

ARCHAEOLOGICAL REGIONS-MIDDLE WOODLAND

Fox Lake Phase

CONTEXT DEFINITION: Ludwickson et al. (1981:116) note that regional specialists tend to categorize the Fox Lake phase as Middle Woodland (Anfinson 1979:79; Gibbon and Caine 1980; Hudak 1974, 1976), but suggest it began during Early Woodland. A few sites attributable to Fox Lake phase have been reported from South Dakota (James Haug, personal communication 1989).

Besant

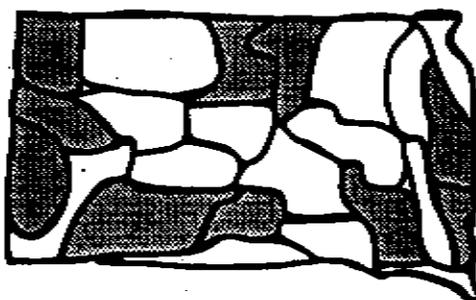

RESEARCH QUESTIONS:

1. Are ceramics associated with Besant?
2. The issue of Besant as a point style as opposed to Besant as a culture or phase.
3. How do sites vary with environmental change from south to north?
4. Is the Sonota complex part of Besant?
5. Does South Dakota have a western "Besant" in the west (like Frison's Ruby site), and an eastern "Besant" in the east (Sonota)?

BESANT SITES (REGIONS 1, 6, 7, 8, 9, 11, 16, 19, 22, 23):

39BK7	39BT10	39BT18	39BU108	39BU184	39BU236
39BU244	39CA189	39CO88	39CO97	39CU154	39DW147

39PN748	39PN895	39PO58	39SH37	39SH75	39SH80
39SH96	39YK41				

ARCHAEOLOGICAL REGIONS-BESANT

Sonota Complex

CONTEXT DEFINITION: Based primarily on mortuary remains; is now considered by some to be Besant.

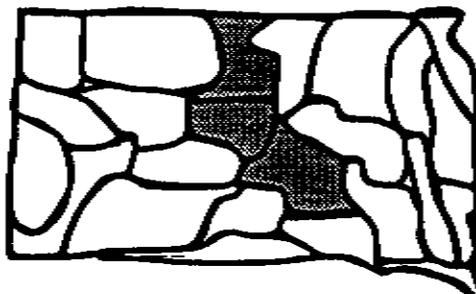

RESEARCH QUESTIONS:

1. Origins of the Sonota complex - temporal parameters of burial mounds/mortuary practices.
2. Evidence of horticulture at this period.

SONOTA COMPLEX SITES (REGIONS 11, 12, 13):

39DW233 (Swift Bird)	39DW240 (Grover Hand)	39DW242 (Stelzer)
39DW252 (Arpan Mound)	39CA4 (Rygh)	39LM161
39ST9 (La Roche-House 2)	39ST80	

ARCHAEOLOGICAL REGIONS-SONOTA COMPLEX

Valley Phase

RESEARCH QUESTIONS:

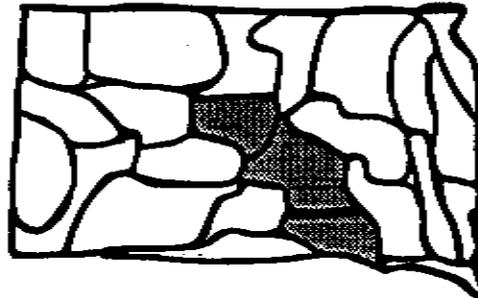

1. Can we document other trappings associated with Valley?

VALLEY PHASE SITES [REGIONS 12, 13, 14]:

39BR101 (Arp)	39CH45 (Hitchell)	39GR1 (Scalp Creek)
39GR2 (Ellis Creek)	39LM238 (Good Soldier)	39ST9 (La Roche)

BIBLIOGRAPHY: Hoffman 1968.

ARCHAEOLOGICAL REGIONS-VALLEY PHASE
(also reported in southeastern SD [Hoffman 1968]).

LATE WOODLAND

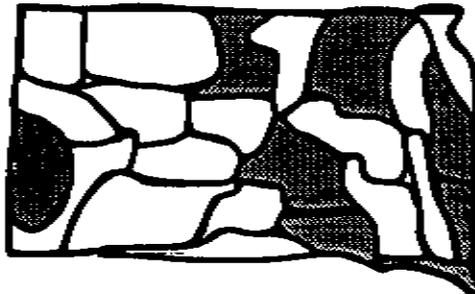

RESEARCH QUESTIONS:

1. Ludwickson et al. (1981:126-127) note that the South Dakota sites Scalp Creek, Ellis Creek, Arp and White Swan may be defined as early Late Woodland upon reanalysis of their artifact assemblages. What are the temporal/cultural affiliations of these sites?

SITES DEFINED AS 'UNASSIGNED LATE WOODLAND' [REGIONS 7, 11, 13, 14, 15, 18, 22, 23]:

39BF224 (Truman Mounds)	39BK7	39BN85	39BR102	39CH106
39CU185	39GT19	39MH34	39MH74	39UN9
				39WW101

ARCHAEOLOGICAL REGIONS-LATE WOODLAND

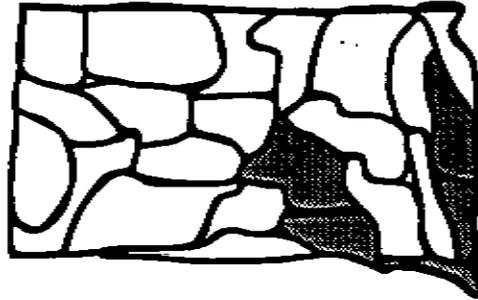

Loseke Creek Phase

LOSEKE CREEK PHASE SITES [REGIONS 13, 14, 15, 22, 23]:

39BF233 (Side Hill Mounds)	39BF234 (Old Quarry Mound)
39BO201 (Tabor)	39BR101 (Arp site)
39BR102	39CH4
39CH9	39CH45
39GR1 (Scalp Creek)	39GR2 (Ellis Creek)
39LK1 (Spawn Mound)	39MH6 (Split Rock Creek Mounds)
39YK203 (Gavins Point)	

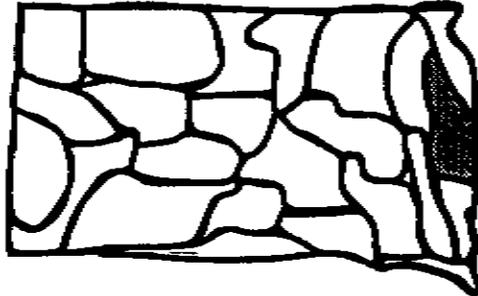

ARCHAEOLOGICAL REGIONS-LOSEKE CREEK PHASE

Lake Benton Phase

CONTEXT DEFINITION: Includes the Winter site, 39DE5 [REGION 23]; other sites are likely along the South Dakota/Minnesota border.

ARCHAEOLOGICAL REGIONS-LAKE BENTON PHASE

ARVILLA COMPLEX

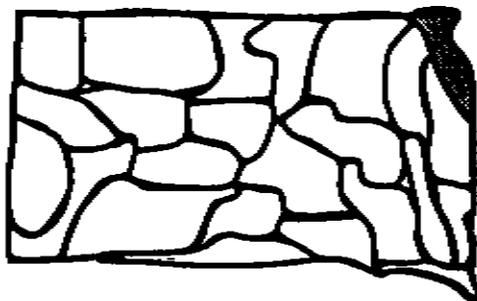

PROPERTY TYPES: Burial mounds.

RESEARCH QUESTIONS:

1. What is the nature of the Arvilla complex? Is it a legitimate taxonomic entity?

BIBLIOGRAPHY: Johnson 1973.

ARCHAEOLOGICAL REGIONS-ARVILLA COMPLEX

GREAT OASIS CONTEXTS

AN INTRODUCTION

CONTEXTS: Only one context is currently identified for Great Oasis.

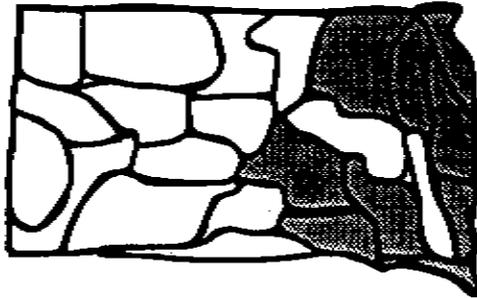

RESEARCH QUESTIONS:

1. The potential role of Great Oasis in the development of the Plains Village tradition has been the subject of considerable discussion (e.g., Alex 1981a, 1981b; Buechler 1982a; E. Henning 1981; Johnston 1967b; Peterson 1967; Tiffany 1982). This question of cultural transition is an extremely important regional issue for which the Ft. Randall Region has considerable research potential.
2. What is the relationship between Great Oasis and the culture producing a Cambria-like ceramic assemblage found in many multiple component sites around the lakes in the Prairie Coteau Region?
3. Can Great Oasis phases be defined on the basis of ceramic variation and/or lifeways?
4. Should Great Oasis be classified as part of the Woodland (Tiffany 1983:96-97) or Initial Middle Missouri tradition (Henning and Henning 1978:14)?
5. Was Great Oasis socio-economic organization pliable enough to adapt to different (environmental) circumstances and was mobility one of their patterns? Or, does Great Oasis represent different ethnic groups with the same technology?
6. Did Great Oasis peoples grow maize or did they trade for it, or do both?

GREAT OASIS SITES (REGIONS 13, 14, 15, 16, 18, 20, 22, 23, 24):

ARCHAEOLOGICAL REGIONS-GREAT OASIS

PLAINS VILLAGE CONTEXTS
AN INTRODUCTION

CONTEXTS: Thirty-four contexts and subcontexts are outlined for the Plains Village period: the **Initial Middle Missouri**, which includes the **Mill Creek variant** (with three defined phases in South Dakota - the **Lower James, Brandon and Big Sioux**) and the **Chamberlain variant** (with three defined phases - the **Grand Detour, Anderson and Swanson**); the **Extended Middle Missouri**, which includes the **Northern Extended variant** (with two defined phases - **Ft. Yates and Nallati**), and the **Southern Extended variant** (with a single defined phase - **Thomas Riggs**); the **Terminal Middle Missouri**; the **Central Plains tradition**; the **Basal Coalescent** (with a single defined phase - **St. Helena**); the **Initial Coalescent**; the **Extended Coalescent** (with one defined phase - **Shannon**, and four defined foci - **Le Compte, La Roche, Bennett and Akaska**); the **Post-Contact Coalescent** (with four defined phases - **Felicia, Talking Crow, Bad River** (including **Bad River I and Bad River II**) and **Le Beau**); and **Unassigned Plains Village**.

RESEARCH QUESTIONS:

1. Develop related support studies (e.g., microfauna, pollen, soil), building on stratigraphic work by Ahler et al. 1974.
2. Basic data collection and development of comparative collections from ceramic sites located on the eastern edge of the Coteau du Missouri. What is the relationship (if any) between these Plains Village populations and groups from the Missouri River trench and James River Basin?
3. Are the early Plains Village sites, such as the Hartford Beach village (Northeast Lowland Region), a transitional cultural group or a relict fringe group? Define the cultural affiliation of these groups.
4. Warfare.
5. Division of labor.

6. Cultural chronology.
7. Ceramic variability.
8. Interrelationships become very complicated. Plains Village should be looked at as a system.
9. What is the nature of the Initial Middle Missouri-like aspects of certain sites in the Black Hills?

UNASSIGNED "PLAINS VILLAGE" SITES [REGIONS 3, 4, 5, 6, 7, 8, 9, 11, 12, 13, 14, 16, 17, 18, 20, 22, 23, 24]:

ARCHAEOLOGICAL REGIONS - ALL ABOVE "VILLAGE" SITES

INITIAL MIDDLE MISSOURI

RESEARCH QUESTIONS:

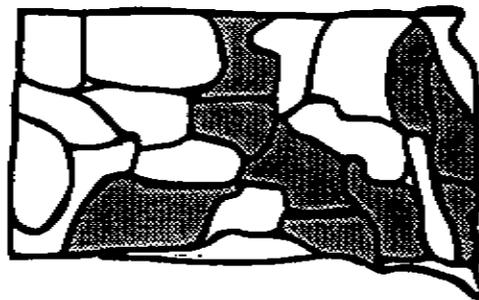

1. Clarify the relationship between the IMM variant and the EMM variant. What happens to IMM if it does not develop into EMM?
2. Taxonomic modification to account for differences between Big Bend area IMM variant sites and Chamberlain area IMM variant ceramic assemblages (Big Bend Region) needs to be investigated.
3. The relationship between IMM variant sites located outside the Missouri River trench with sites on both the James and Missouri rivers needs to be clarified (e.g., Alex 1981a, 1981b).
4. Are there IMM sites in the Black Hills?

INITIAL MIDDLE MISSOURI SITES (REGIONS 8, 11, 12, 13, 14, 16, 20, 22, 23):

39BF11	39BF12	39BF20	39BF44	39BF215	39BF221
39BF227	39BK20	39BR13	39BR16	39BR29	39BR39

ARCHAEOLOGICAL REGIONS-INITIAL MIDDLE MISSOURI

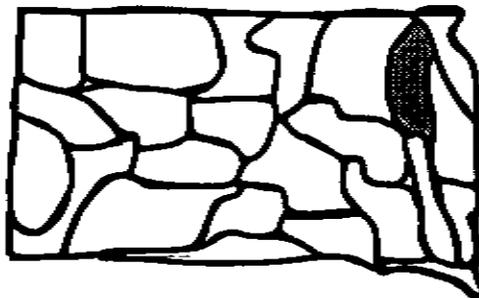

Mill Creek Variant

CONTEXT DEFINITION: Includes Lower James phase, Brandon phase and Big Sioux phase within South Dakota.

MILL CREEK SITE (REGION 20):

39ML9?

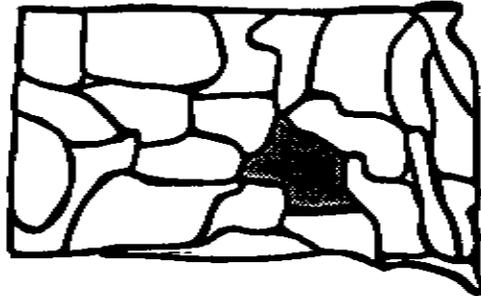

ARCHAEOLOGICAL REGIONS-MILL CREEK VARIANT

Chamberlain Variant

CONTEXT DEFINITION: Includes Grand Detour phase, Anderson phase and Swanson phase.

ARCHAEOLOGICAL REGIONS-CHAMBERLAIN VARIANT

EXTENDED MIDDLE MISSOURI

RESEARCH QUESTIONS:

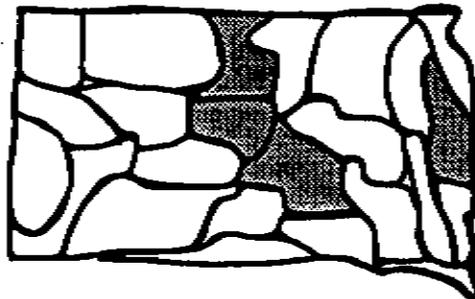

1. Are there any village sites in the Grand/Moreau Region which pre-date A.D. 1100, i.e., are the EMM sites in the Grand/Moreau Region really as early as the dates from Jake White Bull and Calamity would suggest?
2. Reevaluate EMM versus TMM site assignments made by Lehmer (1971). Some are obviously incorrect.
3. Increase sample of radiocarbon dates.
4. Examine EMM and TMM subsistence strategies. Was there an environmental change at the transition?

EXTENDED MIDDLE MISSOURI SITES (REGIONS 11, 12, 13, 23):

39AR8	39AR201	39AR210	39CA1	39CA2	39CA3

ARCHAEOLOGICAL REGIONS-TERMINAL MIDDLE MISSOURI

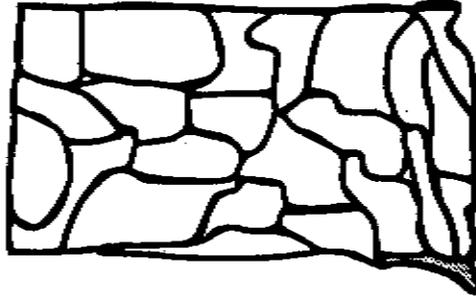

CENTRAL PLAINS TRADITION

CONTEXT DEFINITION: Some of the sites located by the RBS at Angostura Reservoir appear to have Central Plains/Coalescent affiliations and may offer insight into the extent of early Central Plains tradition penetration into South Dakota.

CENTRAL PLAINS TRADITION SITES [REGION 15]:

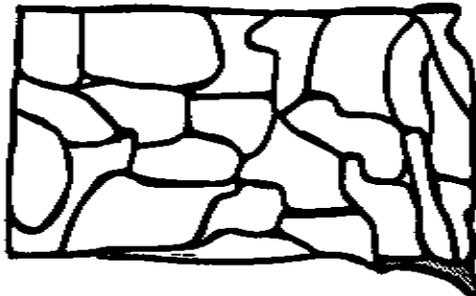

39BO40

ARCHAEOLOGICAL REGIONS-CENTRAL PLAINS TRADITION

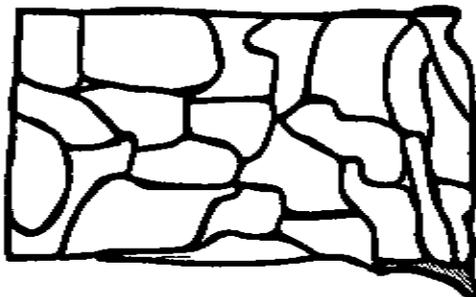

BASAL COALESCENT

ARCHAEOLOGICAL REGIONS-BASAL COALESCENT

St. Helena Phase

ARCHAEOLOGICAL REGIONS-ST. HELENA PHASE

INITIAL COALESCENT

RESEARCH QUESTIONS:

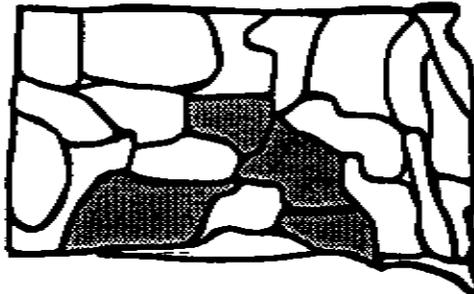

1. Does each IC variant site represent a settlement by a group of people from a single Central Plains tradition locality?
2. There are some indications that some Coalescent variants utilized a greater range of wild plant foods than Middle Missouri variant populations. Is there a fundamental difference in subsistence strategies between Middle Missouri and IC populations?
3. Examine materials from the Granny Two Hearts site.
4. Excavation using state of the art techniques addressing questions of cultural chronology, cultural variability and Arikara origins and adaptations. Techniques may include attribute analysis and ethnographic analysis.

INITIAL COALESCENT SITES (REGIONS 8, 12, 13, 14):

BIBLIOGRAPHY: Winham and Lueck (in press).

ARCHAEOLOGICAL REGIONS-INITIAL COALESCENT

EXTENDED COALESCENT

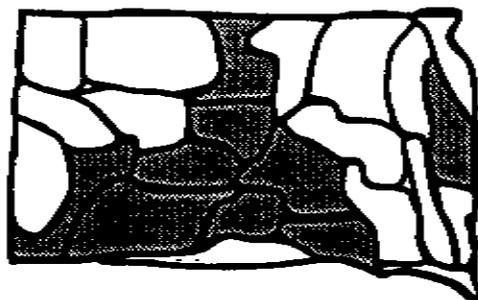

RESEARCH QUESTIONS:

1. Examine temporal problems with EC sites in the Grand/Moreau Region in light of the dates from the Davis village or Lower Grand village.
If these dates prove accurate, what is the effect on our perception of 'Coalescence'?
2. Increase sample of radiocarbon dates as well as thermoluminescent/archeomagnetic dates, i.e., that are not prone to atmospheric C-14 variation through time.
3. Hoffman (1963a) sees EC as representing both Pawnee and Arikara. Detailed analyses of EC and Lower Loup ceramic assemblages might examine this hypothesis (especially in the Big Bend and Fort Randall regions).
4. Define range of variation in size and locations of EC villages, perhaps through comparative subsistence pattern data (winter lodges?).

POST-CONTACT COALESCENT

RESEARCH QUESTIONS:

1. According to Tabeau (Abel 1939; Parks 1979), there are ten different Arikara groups, each autonomous and possibly endogamous. Can these groups be identified in the artifact assemblages, perhaps through micro-style analysis?
2. Focus on the conformity of the traits within the Bad River 1 and Bad River 2 phases. Is there clear evidence for such conformity?

Felicia Phase

TEMPORAL BOUNDARIES: A.D. 1675-A.D. 1700.

Talking Crow Phase

TEMPORAL BOUNDARIES: A.D. 1700-A.D. 1750.

Bad River Phase

TEMPORAL BOUNDARIES: A.D. 1675-A.D. 1795.

CONTEXT DEFINITION: Includes Bad River 1 (A.D. 1675-1740) and Bad River II (A.D. 1740-1795).

Le Beau Phase

TEMPORAL BOUNDARIES: A.D. 1675-A.D. 1780.

ONEOTA CONTEXTS

AN INTRODUCTION

CONTEXTS: Two contexts are outlined, the Olivet phase and Unassigned Oneota.

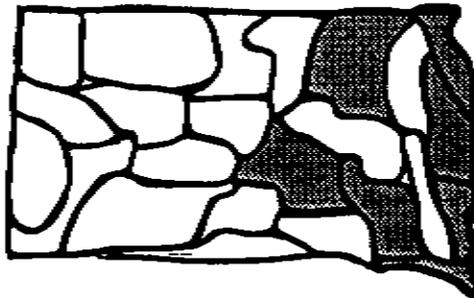

RESEARCH QUESTIONS:

1. Examine Oneota sites on the James River. How do they compare with other Oneota sites? Can they provide information regarding plains adaptation by a prairie population?
2. Is the Blood Run/Rock Island site (Lower Big Sioux Region) the ethnohistoric village of the Omaha? Do the sites have prehistoric and historic components? What are the dates of the occupation?

ONEOTA SITES (REGIONS 13, 15, 16, 18, 22, 23, 24):

OLIVET PHASE

PREHISTORIC THEMATIC SUBCONTEXTS

AN INTRODUCTION

SUBCONTEXTS: Thirteen subcontexts are outlined here - rock art/petroglyphs, rock shelters, stone circles, alignments, bison jumps/kill sites, rock cairns, petroforms/effigies, prehistoric quarries, eagle trapping pits, burial mounds, sacred sites, burials/human remains, and lithic resources and technology.

OVERVIEW: These topics are classified as subcontexts because they should be studied in relation to a specific cultural/temporal period. Given our current state of knowledge, however, it is not possible to assign specific temporal periods to most of these subcontexts. Some of the topics, such as lithic resources, cover the entire cultural/temporal spectrum.

TEMPORAL BOUNDARIES: 12,000 B.C.-A.D. 1750.

SPATIAL BOUNDARIES: Entire state.

SURVEYS: Surveys specific to many of these subcontexts have been undertaken. Most of the historic properties involved are distinctive and this is one reason they are addressed separately in this document.

ROCK ART/PETROGLYPHS

TEMPORAL BOUNDARIES: Site 39FA79 is recorded as Late Archaic. Sites 39FA1048 and 39FA1049 are recorded as Late Prehistoric, while site 39FA819 is identified as Siouan in the current SARC database.

RESEARCH QUESTIONS:

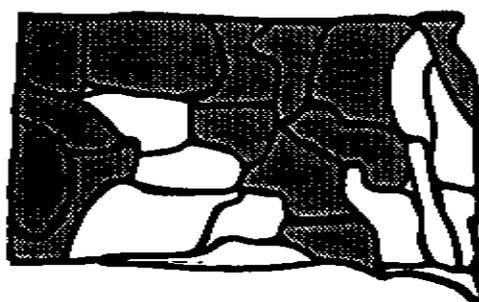

1. Comparative rock art research to link North Cave Hills styles with those of the Southern Black Hills.
2. Examine the concept of the Northern Hills as a contact zone.
3. Is the boulder art of eastern South Dakota Siouan?
4. Studies addressing symbolism and the development of temporal sequences.
5. Petroform function and distribution.
6. Did the production of rock art in the Black Hills begin during the Middle Plains/Late Plains Archaic transition (see Sundstrom 1984)? If not, when?
7. What temporal sequences are present in rock art styles and can they be used to relatively or otherwise date the known sites?
8. What does rock art represent (i.e., symbolism of belief systems, recordation of events, directional symbols, other forms of communication, etc.)?

ROCK ART SITES NOT SPECIFIED AS A.D. 1861-/EURO-AMERICAN [REGIONS 1, 2, 5, 6, 7, 11, 12, 13, 14, 17, 18, 19, 24]:

ARCHEOLOGICAL REGIONS-ROCK SHELTERS

STONE CIRCLES

TEMPORAL BOUNDARIES

Only nine stone circle sites are currently assigned a cultural or temporal affiliation in the SARC database.

39PN375	McKean
39CU806	Late Prehistoric
39PO23	Plains Village
39BE89	A.D. 900-1700
39CH200	A.D. 900-1700
39CU878	A.D. 1700-1861/Sioux
39MD33B	Lakota
39GR14	A.D. 1861-
39SL238	A.D. 1861-

Winham (1982) has assigned an additional seven stone circle sites to cultural/ temporal periods.

39MP14	Middle Plains Archaic (Oxbow/McKean)
39MP23	Late Plains Archaic (Pelican Lake)
39ED17	Late Plains Archaic (Pelican Lake)
39MP15	Besant
39MP21	Besant
39BN25	Plains Woodland
39MP11	Late Prehistoric

RESEARCH QUESTIONS:

[Questions from Black Hills National Forest solicitation No. R2-03-90-12].

1. What is the temporal dimension for stone circle sites? When did stone circles come into use?
2. What is the range of variability among stone circle sites?
3. Are chemical differences in soils able to relatively date stone circles on an intra-site basis (see Dormaar 1976)?
4. How does a stone circle site layout reflect social organization?
5. Does the size, location, or content of the site reflect seasonal patterning of subsistence?
6. Do the diameter or other design features of stone circles indicate temporal affiliation or change through time?
7. Can the type of entryway on a tepee be determined from stone circle attributes?
8. Can short cut versus normal cut tepee types be discerned from stone circles?
9. Can stone circle size be used to identify tribal affiliation of site occupants through comparison of dated sites and ethnographic accounts of tepee size?
10. Does intra-site stone circle size variation and/or placement indicate social organization, status or wealth of its occupants?
11. On an intra-site basis, do smaller diameter stone circles indicate functions other than living structures (i.e., sweatlodges, play items, etc.)?
12. What do multiple hearth features within a single stone circle represent?
13. Does the size and/or plan of a stone circle vary through seasonal rounds?
14. Does stone circle arrangement vary from band to tribe camps?
15. Are stone circle sites necessarily linked to bison hunting groups?
16. What does the variation in the distribution and density of stone circle sites in a study area (e.g., Black Hills) indicate or represent?

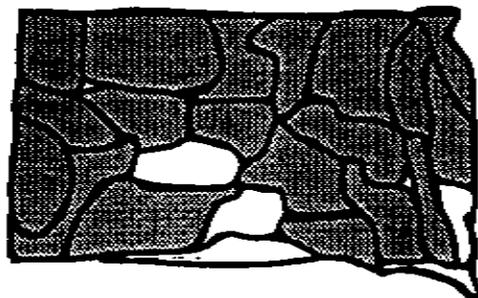

STONE CIRCLE SITES (REGIONS 1, 2, 3, 5, 6, 7, 8, 11, 12, 13, 14, 16, 17, 18, 19, 20, 21, 23, 24):

ARCHAEOLOGICAL REGIONS-BURIAL MOUND SITES

SACRED SITES

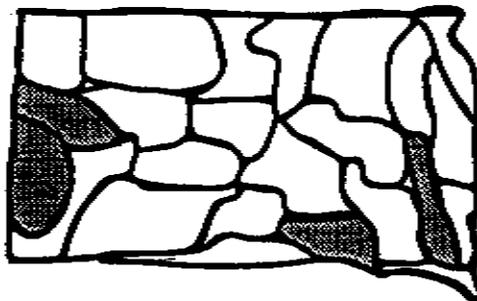

CONTEXT DEFINITION: Sundstrom (1990) has argued that personal religious observations along the lines of the vision quest were a part of prehistoric cultures in the vicinity of the Black Hills well back into the Late Prehistoric period/latter part of the Archaic period.

RESEARCH QUESTIONS:

1. How reflective of past beliefs/ceremonies are modern spiritual beliefs and practices?
2. Is the sacred/profane dichotomy appropriate for pre-contact Native American sites? This is a culture-bound concept and one which Native American cultures appear not to have shared with our own.

BIBLIOGRAPHY: Sundstrom 1990.

ARCHAEOLOGICAL REGIONS-SACRED SITES

BURIALS/HUMAN REMAINS

TEMPORAL BOUNDARIES: All periods.

SPATIAL BOUNDARIES: All areas.

PROPERTY TYPES: Inhumations, cremations, cemeteries, any human remains **excluding** burials in mounds.

VOIDS IN RESEARCH: No systematic record of burials within sites.

GOALS AND PRIORITIES: To create a complete record of all sites from which human remains have been recovered.

SITES DEFINED AS 'BURIALS' (with no cultural/temporal affiliation) [REGIONS 1, 3, 5, 6, 7, 8, 11, 12, 13, 14, 15, 17, 18, 19, 22, 23, 24]:

ARCHAEOLOGICAL REGIONS - ALL ABOVE BURIALS/HUMAN REMAINS

LITHIC RESOURCES AND TECHNOLOGY

RESEARCH QUESTIONS:

[Questions from Black Hills National Forest solicitation No. R2-03-90-12].

1. Do debitage morphological attributes indicate changing lithic technology and cultural affiliation? How?
2. Can lithic tool kits for various tasks be isolated and identified? Do they vary between cultural groups?
3. Can preferred lithic types (based on amounts per site) reflect changing cultural groups?
4. What lithic procurement techniques were practiced by which cultural groups?
5. For a given study area, what exotic lithics are present on procurement sites, where are they from, why are they present, and what was their function?
6. How do lithic procurement strategies change through time?
7. How does a change in lithic procurement strategies affect a site's artifact content?
8. What other types of activities were occurring at lithic procurement sites?
9. What is indicated by different knapping and procurement techniques?
10. What are the appropriate methodologies archaeologists should utilize to study lithic procurement sites?

**PROTOHISTORIC/CONTACT
SUBCONTEXTS
AN INTRODUCTION**

HISTORIC NATIVE AMERICAN TRIBES

SPATIAL BOUNDARIES: Entire state.

CONTEXT DEFINITION: Numerous subcontexts can be developed from sites associated with historically-documented Native American tribal groups, such as:

- Mandan
- Hidatsa
- Arikara
- Crow
- Cheyenne
- Shoshonean
- Wiciyela Sioux (Middle)
 - Yankton (Nakota dialect)
 - Yanktonai (Nakota dialect)
- Teton Sioux (Western)
 - Teton (Lakota dialect)
 - Oglala; Brule; Miniconjou;
 - Two Kettle; Sans Arc; Hunkpapa
- Santee Sioux (Eastern)
 - Wahpeton (Dakota dialect)
 - Sisseton (Dakota dialect)
 - Mdewakantonwan (Dakota dialect)
 - Wahpekute (Dakota dialect)
- Apache (Dismal River)/Kiowa, Kiowa-Apache/Padouca/Gataka
Ioway, Oto/Omaha, Ponca
- Southern Ute

RESEARCH QUESTIONS:

1. Can Nakota/Middle Dakota Sioux sites be identified archaeologically?
2. Can Sioux acculturation be identified archaeologically?
3. Siouan adaptation to reservation life.
4. Siouan migrations into the area.
5. Ethnohistoric identification of the Yankton Sioux.
6. Provide proper identification of the Sioux band involved in the Battle of Slim Buttes (Sandstone Buttes Region).
7. Which village(s) did the Verendrye Expedition visit? Perhaps dendrochronological research in the Pierre vicinity might narrow the range of possible sites.
8. What cultural changes occurred as a result of the adaptation of the horse as a transportation mode?
9. When were the Kiowa-Apache present in and around the Black Hills and what uses were they making of the area?
10. In the light of the Kiowa-Apache tradition identifying the southern Black Hills as their homeland (Mooney 1898), can any archaeological sites be attributed to them?
11. Does archaeological evidence of conflict between the Kiowa-Apache and Snake in 1741 exist within the Black Hills (Lazio 1978)?

12. Is evidence of the Kiowa-Apache trade with the Spanish (including the introduction of the horse) present in the Black Hills?
13. Are obsidian and/or Dismal River ceramics an indicator of Kiowa/Apache presence (Lazio 1978)?

Railroads

CONTEXT DEFINITION: SEE HISTORIC CONTEXT: TRANSPORTATION, Railroads in South Dakota

RESEARCH QUESTIONS:

[Questions from Black Hills National Forest solicitation No. R2-03-90-12].

Questions concerning railroads in the Black Hills include:

1. What companies were in operation or planned operations?
2. What effect did railroads have on settlement patterns in the Black Hills?
3. Did the arrival of the railroad specifically cause an increase of population in the Black Hills? Was the increase significant?
4. What was the railroad's effect on the logging, mining and tourism industries in the Black Hills?

NATIONAL REGISTER LISTINGS: All railroads have been determined eligible for nomination to the National Register of Historic Places.

BIBLIOGRAPHY: State Historical Preservation Center 1991a, 1991b.

Homesteads

TEMPORAL BOUNDARIES: The following 'cabins' are described as 'Sioux' or 'Native American': 39BF204, 39BF217, 39CU615, 39HU90, 39HU218, 39LM224, 39TD19. The others listed below are Euro-American, 'Historic', or unassigned.

RESEARCH QUESTIONS

[Questions from Black Hills National Forest solicitation No. R2-03-90-12].

Black Hills settlement and homesteading questions include:

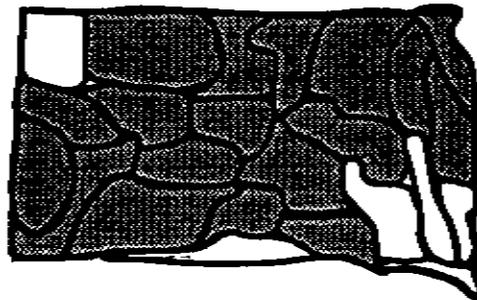

1. Where were the first settlements? Illegal mining settlements, homesteads, ranches?
2. Can a basic style of architecture and/or lay-out be assigned to the early ranches? To the homesteads?

SITES DEFINED AS CABINS [REGIONS 2, 3, 4, 5, 6, 7, 8, 9, 11, 12, 13, 14, 17, 18, 19, 20, 23, 24]:

ARCHAEOLOGICAL REGIONS-HOMESTEAD SITES

Ethnic Settlement

RESEARCH QUESTIONS:

[Questions from Black Hills National Forest solicitation No. R2-03-90-12].

1. What styles of architecture found in South Dakota can be associated with the various ethnic groups? Can these different architectural styles be determined from archaeological sites, when typically only foundations remain?

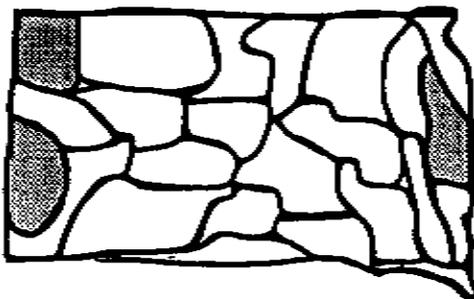

HISTORIC EURO-AMERICAN MISCELLANEOUS CONTEXTS

ROCK ART

ROCK ART SITES SPECIFIED AS A.D. 1861- OR EURO-AMERICAN [REGIONS 1, 7, 23]:

39CU854	39CU861	39DE19	39FA678	39FA877	39HN9
39LK3	39PN978				

ARCHAEOLOGICAL REGIONS-HISTORIC EURO-AMERICAN ROCK ART SITES

SECTION 11 - ARCHAEOLOGICAL REGIONS

Introduction - How The Regions Are Defined

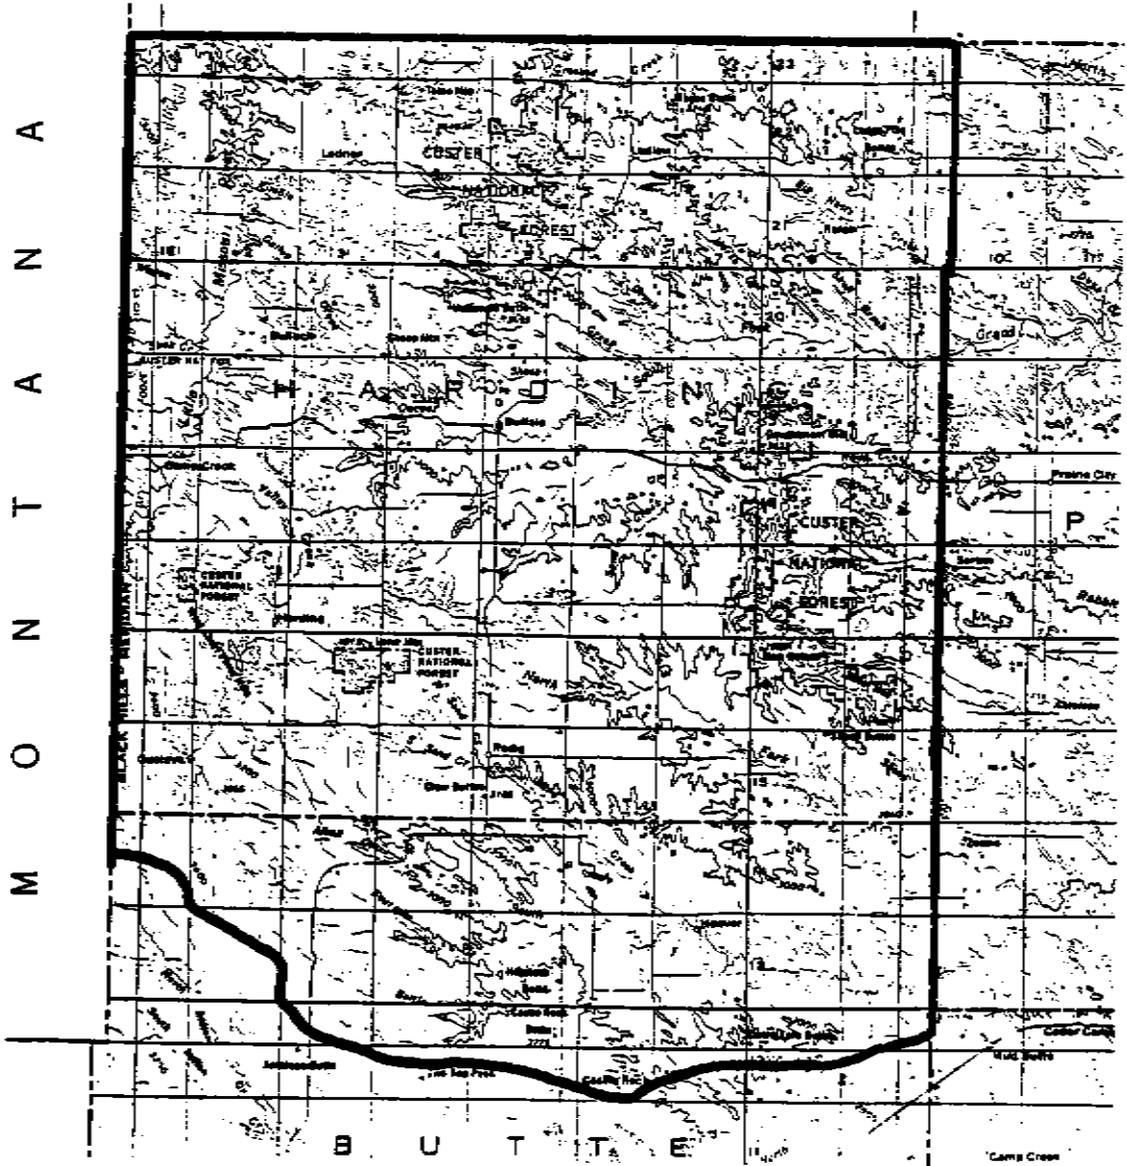

The primary considerations in defining the archaeological regions were drainage basins, previously-defined areas, and utility as management regions. This mix of considerations produced the approximate boundaries indicated on the regional maps preceding each section. In some cases, strict adherence to drainage morphology has been replaced by the use of road, rail, county or other boundaries that were considered a more useful management tool.

Current State Of Regional Syntheses

Currently, the only regional synthesis report published is that for the White River Badlands Region (#8) (Winham, Hannus and Lueck 1989). Reports for the Lower Big Sioux and the Upper Big Sioux archaeological regions are forthcoming (Winham, in prep.1990). A regional synthesis of the Black Hills National Forest has been completed (Cassells, Miller and Miller 1984), and is to be updated and expanded to address the entire Black Hills Archaeological Region (Lance Rom, personal communication 1990). Syntheses for the Belle Fourche and James River regions can be expected in the next few years.

**ARCHAEOLOGICAL REGION
SUMMARIES**

SANDSTONE BUTTES

SANDSTONE BUTTES

ARCHAEOLOGICAL REGION #1

SETTING

The Sandstone Buttes Region encompasses the extreme northwestern corner of South Dakota. The region includes all of Harding County and that portion of Butte County north of the Moreau River drainage basin. Physiographically this area is part of the Cretaceous Tablelands Section of the Missouri Plateau Division of the Great Plains (Rothrock 1943). The topography consists of rolling prairie surrounding oasis-like pine parklands characterized by "deep, narrow canyons, massive shale, limestone, and sandstone cliffs, and isolated flat-topped mesas capped with ponderosa pine forests" (Beckes and Keyser 1983:211). Primary drainages of the area include the Little Missouri, Grand, and Moreau rivers.

SUMMARY OF PREVIOUS ARCHAEOLOGICAL INVESTIGATIONS

Archaeological research in this area was conducted intermittently from the early 1900s through the early 1970s. Since the mid-1970s, small-scale contract surveys have focused on energy development, road construction, gravel quarrying, and transmission line placement projects. Early references to sites in the area are made by Will (1909), Over (1936, 1941), and Gant (1961, 1962a). Later publications discussing the resources of the area include Wood (1971), L. Alex (1979a, 1979b), Davis (1980), and Floden (1984). Major research projects include an inventory and synthesis of resources within the Custer National Forest (Beckes and Keyser 1983; Keyser 1984), a sample survey of state-owned property adjacent to Forest Service lands (Chevance and Chevance 1983), and a sample survey of the Little Missouri River valley (Chevance and Chevance 1984).

HISTORIC CONTEXTS

PALEOINDIAN: Archaeological materials dating to this temporal/cultural period have been recognized in surface collections; however, no documented sites have been recorded in a cultural context (Beckes and Keyser 1983; Chevance and Chevance 1983, 1984; Gant 1961).

EARLY ARCHAIC: Five sites have produced artifacts that resemble Early Plains Archaic types, or occur in depositional settings that imply the presence of Early Plains Archaic period deposits. These sites are 39HN221, Ludlow Cave (39HN1), Thomas Creek (39HN2), the Reva site

(39HN3), and Lightning Spring (39HN204) (Beckes and Keyser 1983). However, no sites dating to this period have been positively identified.

MIDDLE ARCHAIC:

MCKEAN/DUNCAN/HANNA. Materials dating to the McKean complex have been reported by Beckes and Keyser (1983), Buechler (1984c) and Chevance and Chevance (1983). Intensive investigations have been conducted at the Lightning Spring site, a stratified, multicomponent site located in the North Cave Hills of Harding County. Eleven components were encountered in an excavation more than 12 feet deep. The lowest four components represent McKean complex occupations of the site (Beckes and Keyser 1983).

LATE ARCHAIC: This region contains considerable evidence of sites representing the Late Plains Archaic period. Beckes and Keyser (1983) and Chevance and Chevance (1983, 1984) report a number of diagnostic artifacts collected from the surface. In addition to the surface-collected sites, two excavated sites, the Lightning Spring site (components 2 through 7) and the Reva site, have produced Late Plains Archaic materials.

LATE PREHISTORIC: Materials dating to this temporal/cultural period are well-represented in the region. Small side-notched projectile points characteristic of the period have been collected from a large number of sites (e.g., Beckes and Keyser 1983; Chevance and Chevance 1983, 1984). In addition to surface collections, excavations at Ludlow and Pelham's caves have produced large projectile point assemblages.

AVONLEA. Some 31 projectile points or point fragments from the Ludlow Cave materials have been identified as Avonlea (Hannus and Nowak 1988:184).

PLAINS VILLAGE: Excavations of rockshelters in the Cave Hills have produced large samples of ceramics (L. Alex 1979a, 1979b; Over 1936; Wood 1971a). These materials date to the IMM and PCC variants of the Plain Village tradition.

INITIAL MIDDLE MISSOURI.

POST-CONTACT COALESCENT.

PREHISTORIC THEMATIC:

ROCK ART. Petroglyphs found at a number of locations in the North Cave Hills have been associated with the Late Prehistoric-Plains Village temporal period.

STONE CIRCLES.

PROTOHISTORIC/CONTACT PERIOD: Sites assigned to the protohistoric temporal period are not well-documented in this region. Keyser (1984) reports biographic style rock art at four locations in the

North Cave Hills depicting horses and guns. Artifacts recovered from the upper deposits of Ludlow Cave (Over 1936) include metal projectile points, brass rings, glass beads, and parts of a military uniform. Will (1909) reports two conical timber wickiups in the Slim Buttes area that were apparently constructed between 1850 and 1890 for use by war parties or for eagle trapping activities.

Historic archaeological resources are poorly-documented in the region. One site, the battle of Slim Buttes, fought in Harding County, is well-documented. This battle took place in 1876 when cavalry under the command of General Crook ambushed and destroyed a band of Sioux Indians following the Battle of the Little Big Horn.

HISTORIC NATIVE AMERICAN TRIBES.

HIDATSA: Eagle trapping pits?

ARIKARA:

CROW: Study development of Crow tribe?

SHOSHONEAN: Shoshonean utilization of the area is suggested by the shield-bearing warrior rock art style (Keyser 1984).

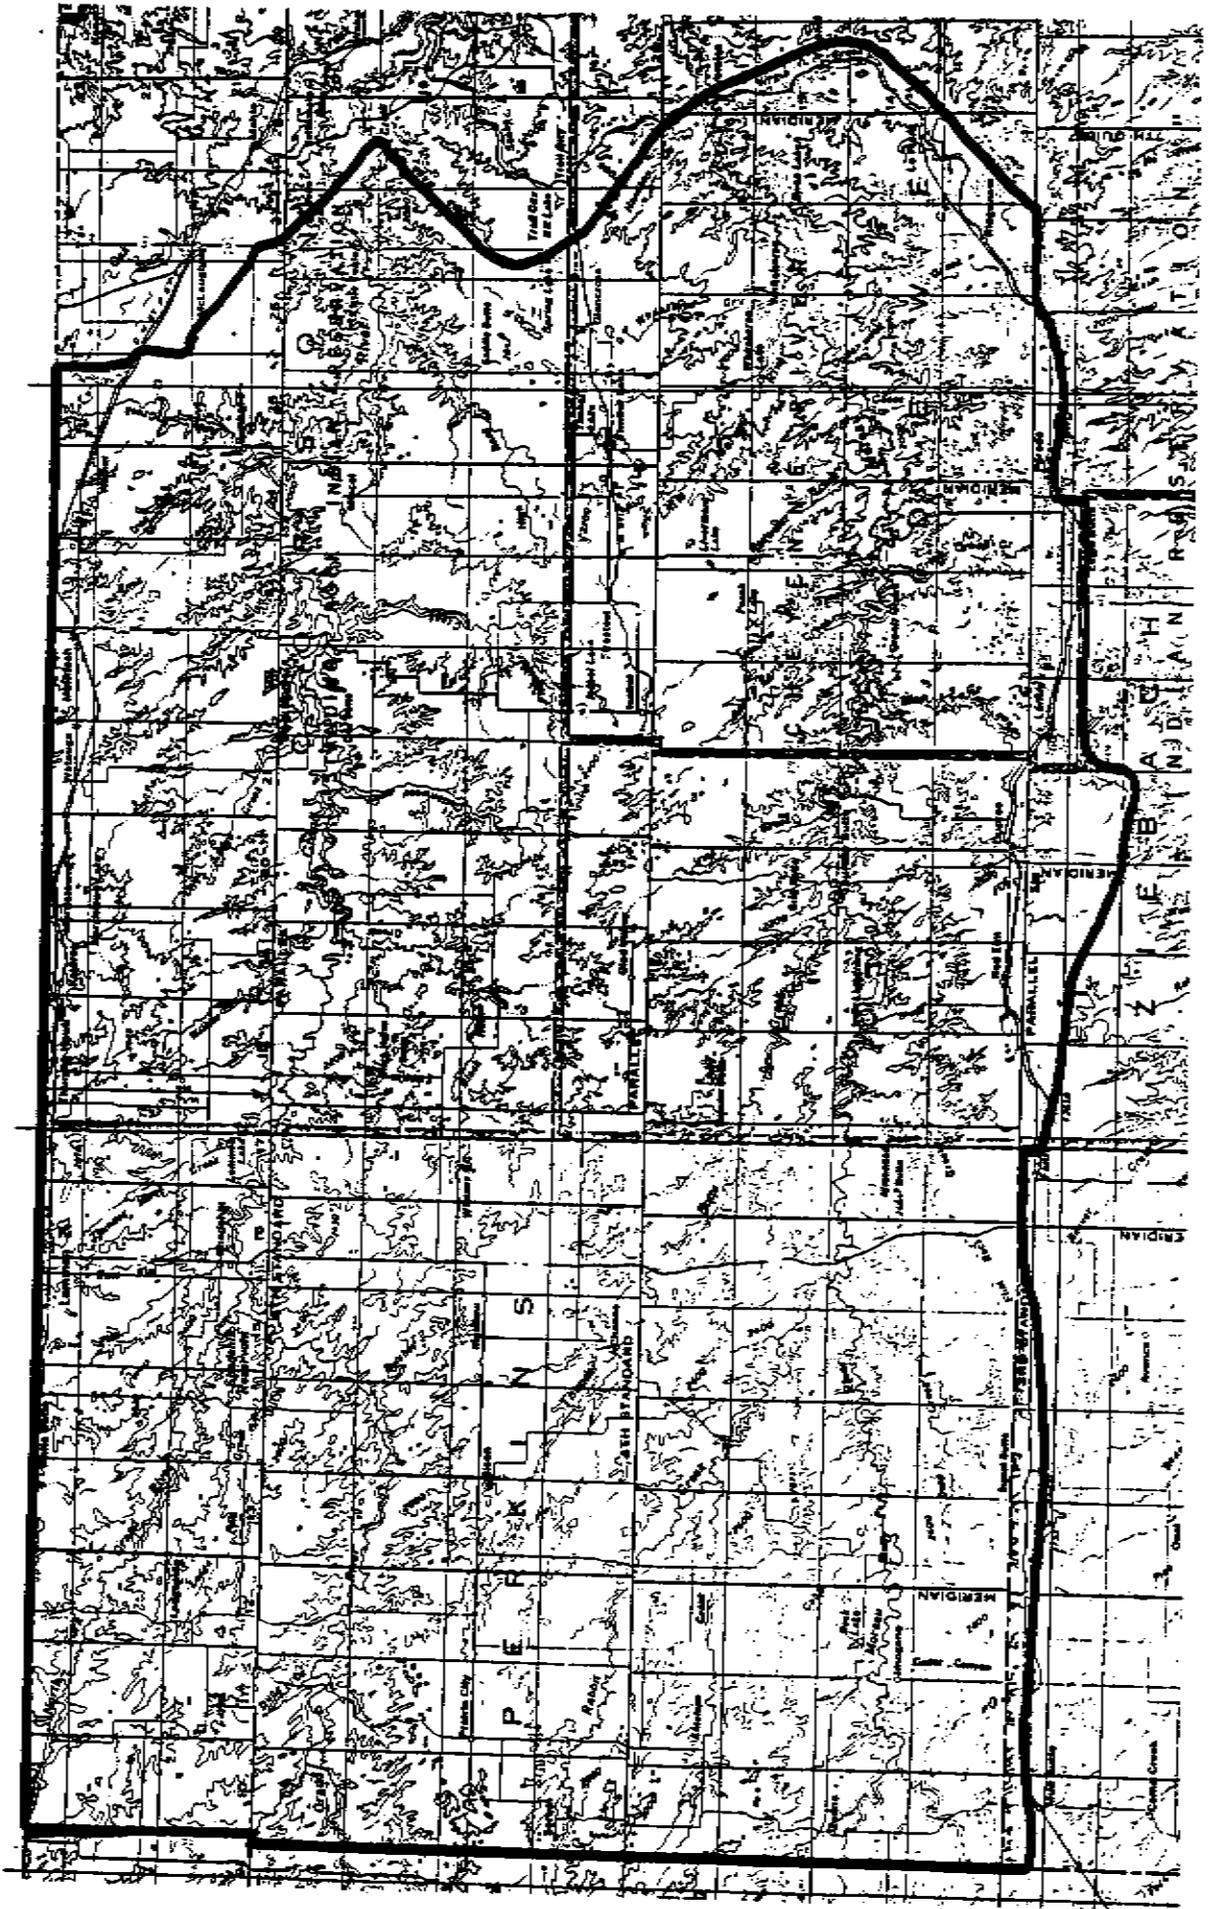

SIOUX:

SANDSTONE BUTTES DISCUSSION

Past research in the region has focused on areas in or near the Sioux Ranger District of the Custer National Forest. This bias is a result of research objectives of the Forest Service as well as the concentration of energy development projects near the forest units, especially near the North Cave Hills unit in north central Harding County. Biases also exist because of the difference in federal and state laws concerning energy development.

Basic inventory to expand the resource base is needed, including a focus on examining deeply-stratified sites, to develop local cultural sequences. Late Prehistoric, western South Dakota research questions are particularly relevant in this region, and stratified sites such as Ludlow Cave and Lightning Springs are particularly significant for these studies.

GRAND/MOREAU TABLELANDS

GRAND/MOREAU TABLELANDS

ARCHAEOLOGICAL REGION #2

SETTING

The Grand/Moreau Tablelands Region consists of the central Grand and Moreau River drainage basins encompassing all of Perkins County, the western two-thirds of Corson and Dewey counties, and the northern 'panhandle' of Ziebach County. Physiographically, this area has been assigned to the Cretaceous Tablelands Section of the Missouri Plateau of the Great Plains (Rothrock 1943). The area can be characterized as rolling grasslands broken by occasional high isolated buttes, and by the broad, shallow valleys of the Grand and Moreau rivers.

SUMMARY OF PREVIOUS ARCHAEOLOGICAL INVESTIGATIONS

Little archaeological research has been undertaken in the Grand/Moreau Tablelands Region. The first professional fieldwork in the area was conducted under the auspices of the RBS in areas of anticipated reservoir construction. In 1946, a field party under the supervision of Waldo Wedel conducted a brief survey of the Shadehill Reservoir in Perkins County (Cooper and Wedel 1947). Six sites were recorded during the course of the fieldwork: lithic scatters, two rock cairns, and two depressions resembling earthlodge locations. A large deposit of bison bone suggesting a possible bison jump or kill site and two paleontological sites were also recorded. None of the sites were tested. In 1949, a similar RBS investigation was conducted by R. P. Wheeler in the basin of the proposed Bixby Reservoir in Perkins County. Two artifact scatters were reported (Wedel and Wheeler 1949). This investigation was conducted in the late 1940s. Since this early research, a few small-scale contract surveys have been conducted in the region (e.g., Chevance 1985a, 1986b; Lazio 1980a; Messerli 1986e).

HISTORIC CONTEXTS

PALEOINDIAN: Site 39PE11, recorded by Wheeler, may date to the late Paleoindian period.

PLAINS VILLAGE: Beckes and Keyser (1983) have suggested that site 39PE10, recorded by Wheeler, may represent utilization of the area by village populations from the Missouri River trench.

PROTOHISTORIC/CONTACT PERIOD:

HISTORIC NATIVE AMERICAN TRIBES.

CHEYENNE: Wood's (1971b) research suggests the eastern portion of the region may contribute to an evaluation of Cheyenne ethnohistoric occupation during the Protohistoric period.

SIOUX: Standing Rock/Cheyenne River reservations.

SOUTHERN UTE: Historic occupation of the area by Southern Ute populations in 1903.

HISTORIC EURO-AMERICAN:

EARLY COMMERCIAL EXPLOITATION AND MILITARY PRESENCE.

TRAILS: The historic Bismarck to Deadwood trail also passes through the region (Holst 1983).

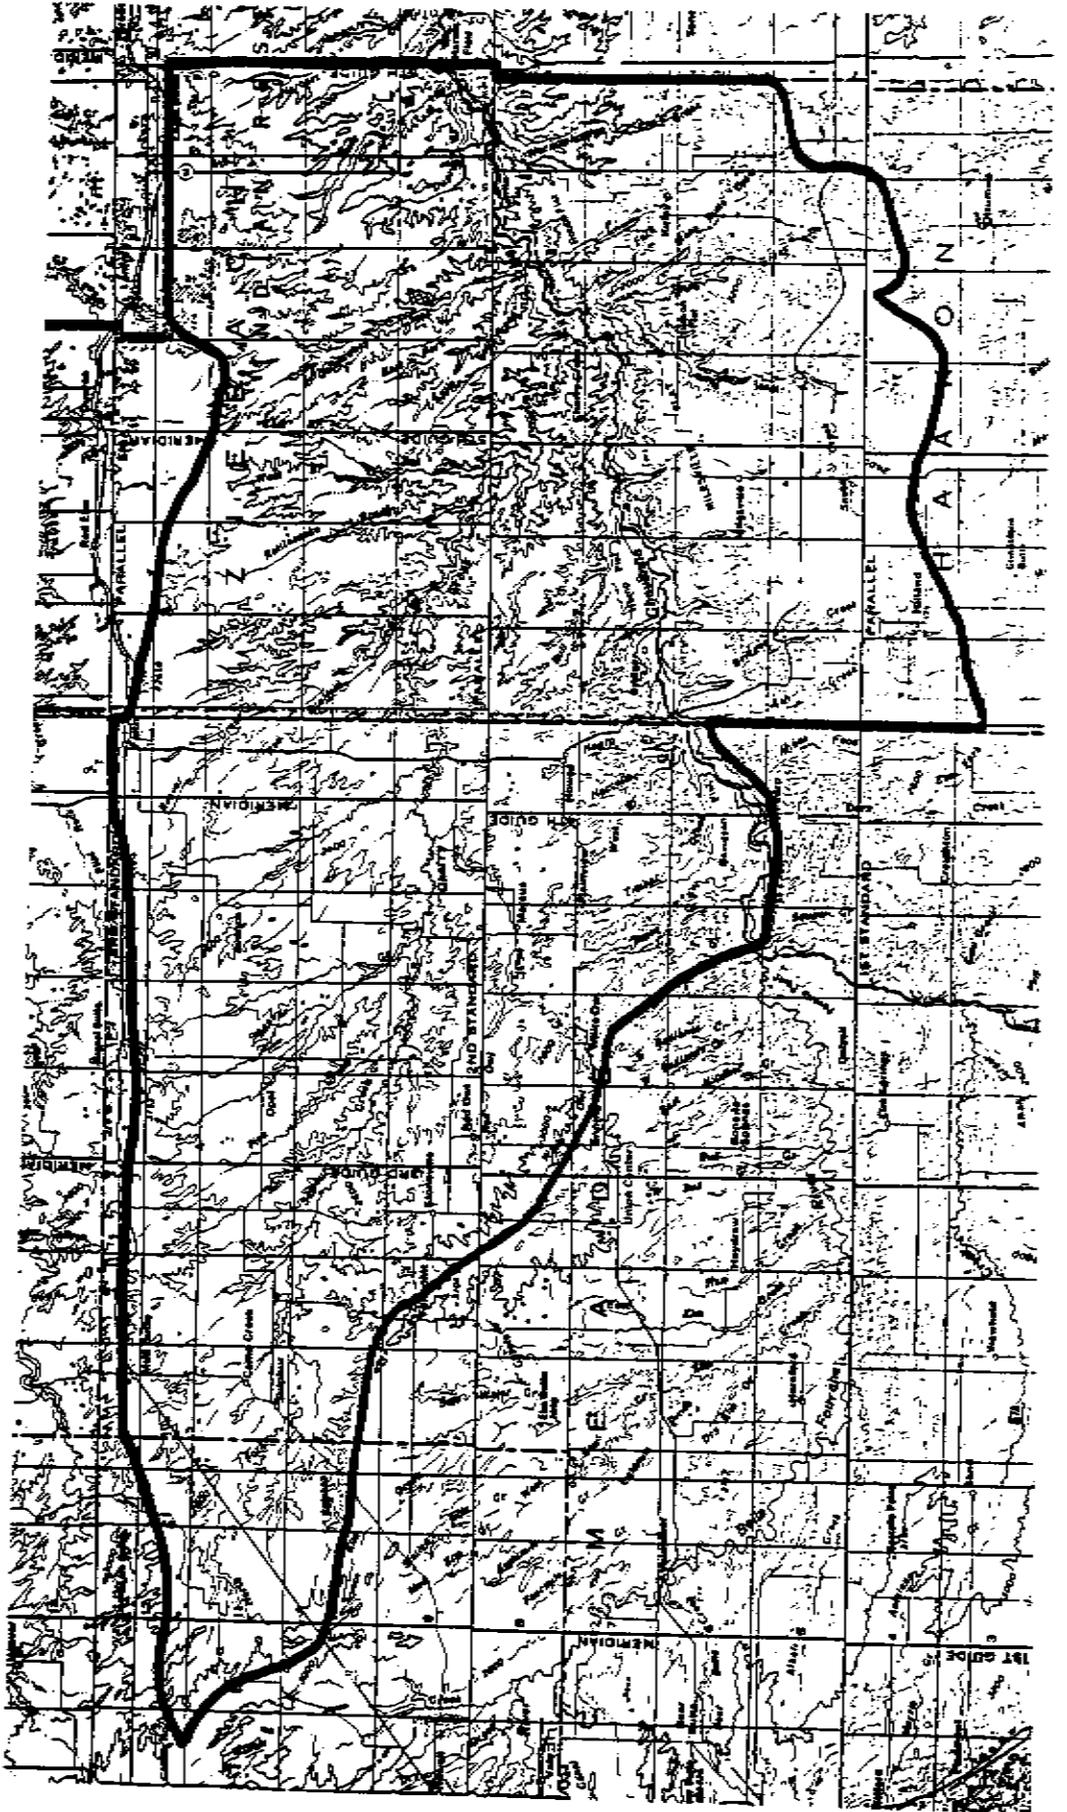

GRAND/MOREAU TABLELANDS DISCUSSION

The area has great archaeological potential but until a basic data base has been compiled, specific research questions are difficult to anticipate. Any archaeological resource in a cultural context (i.e. that has integrity) will provide a contribution to an understanding of the cultural dynamics of the area.

The results of limited research in the Grand River National Grasslands suggest the presence of deeply-buried multicomponent sites; however, the ages of these occupations have not been identified (Beckes and Keyser 1983). Lithic procurement studies in the vicinity of White Butte (Ahler 1977a) and Arrowhead Hill (Sneve 1973) could be built upon.

Research could be conducted to consider whether the valleys were utilized in the same or different fashions during all prehistoric periods and what conclusions may be drawn about man's use of the region based on the results of this research.

CENTRAL CHEYENNE

CENTRAL CHEYENNE

ARCHAEOLOGICAL REGION #3

SETTING

The Central Cheyenne Region covers east-central Butte County, northern Meade County (north of the Belle Fourche River drainage and the Cheyenne River) and southern Ziebach County, and extends north of the Bad River drainage in Haakon County. The area is comprised of the Cheyenne River valley, terraces, breaks, and adjacent plains and is characterized by a topography of rolling grasslands broken by occasional high isolated buttes or ridges.

SUMMARY OF PREVIOUS ARCHAEOLOGICAL INVESTIGATIONS

Previous research in this region has included limited investigations conducted for uranium exploration, water delivery systems (e.g., Artz 1980; Lazio 1980a; Nowak 1981a), a gravel quarry, and electric transmission line projects. A number of Sioux camps are recorded along the Cheyenne River (Anderson 1956) and the Cheyenne River Sioux Agency habitation is located in this region.

HISTORIC CONTEXTS

PROTOHISTORIC/CONTACT PERIOD:

HISTORIC NATIVE AMERICAN TRIBES.

SIoux: Camps along the Cheyenne River include those of Big Foot, Bear Eagle, Red Skirt, Touch The Clouds, Hump, and Corn. RESERVATIONS.

Cheyenne River Sioux Reservation.

Cheyenne River Sioux Agency habitation (Little Bear's Camp) along Cheyenne River bottomlands near mouth of Plum Creek.

Ghost Dance: In 1890, the Cherry Creek community and Cheyenne City were important centers for Ghost Dance ceremonies (Nowak 1981a).

HISTORIC EURO-AMERICAN:

EARLY COMMERCIAL EXPLOITATION AND MILITARY PRESENCE.

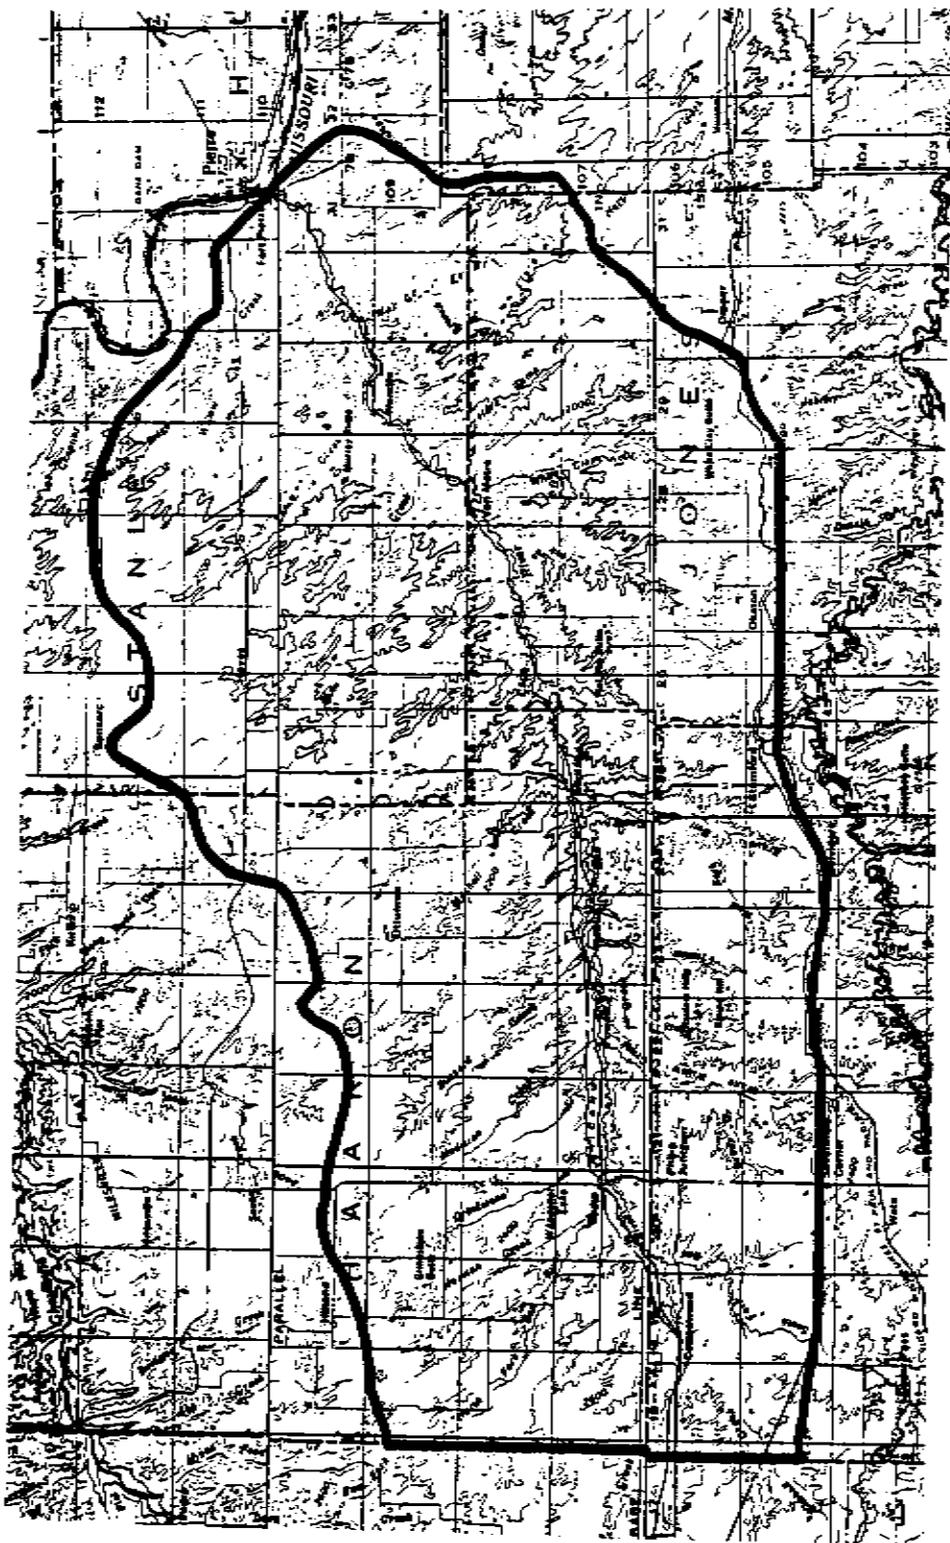

FUR TRADING POSTS: Trading post at Cherry Creek in 1832. The walls of this structure are reported to have been trenched but it was not properly excavated and recent attempts to relocate the site were unsuccessful (Lazio 1982).

TRAILS: Historic Deadwood to Bismarck trail (Holst 1983). Also reports of an historic trail between the Bad River drainage and the Cheyenne River along East or West Plum Creek (?).

CENTRAL CHEYENNE DISCUSSION

Virtually nothing is known about the archaeological resources of the region. Deeply-buried hearths have been reported but they have not been professionally-documented. Basic inventory/data collection are primary goals for the region at this time.

BAD RIVER BASIN

BAD RIVER BASIN

ARCHAEOLOGICAL REGION #4

SETTING

The Bad River Basin Region encompasses the Bad River drainage basin located in extreme eastern Pennington County; southern Haakon County; northern Jackson County; northern Jones County; and southwestern Stanley County. The area is part of the Pierre Hills physiographic zone and is characterized by rolling grasslands surrounding the Bad River valley.

SUMMARY OF PREVIOUS ARCHAEOLOGICAL INVESTIGATIONS

Smithsonian Institution, River Basin Surveys were conducted at the proposed Philip Reservoir site along the north fork of the Bad River in 1949. However, no sites were recorded (Wheeler and Wedel 1949). Beyond that investigation, the area has received little professional attention other than small-scale contract projects (Artz 1980; Buechler 1986c, 1987m; Nowak 1981b, 1981c; Winham, Nowak and Butterbrodt 1984). Test excavations have been conducted at the Herman site, located in Jones County, but the results remain inconclusive (Alex and Zimmerman 1978).

HISTORIC CONTEXTS

PLAINS VILLAGE: The region has the potential for examining Extended and PCC utilization.

PROTOHISTORIC/CONTACT PERIOD:

HISTORIC NATIVE AMERICAN TRIBES.

SIoux: Research could investigate early Teton Sioux encampments west of the Missouri River, focusing on Siouan migration into the region (Lazio 1978).

PADOUCA/GATAKA: Investigation of Padouca/Gataka utilization of the area (Lazio 1978).

HISTORIC EURO-AMERICAN:

EARLY COMMERCIAL EXPLOITATION AND MILITARY PRESENCE.

TRAILS: Investigate early military, Indian and commercial trails or routes across the area (Ft. Pierre to Deadwood trail and the Peno Springs trail).

OTHER EURO-AMERICAN.

FARM AND RANCH: Pioneer ranching operations such as the first Scotty Phillips ranch near Grindstone Butte in west central Haakon County.

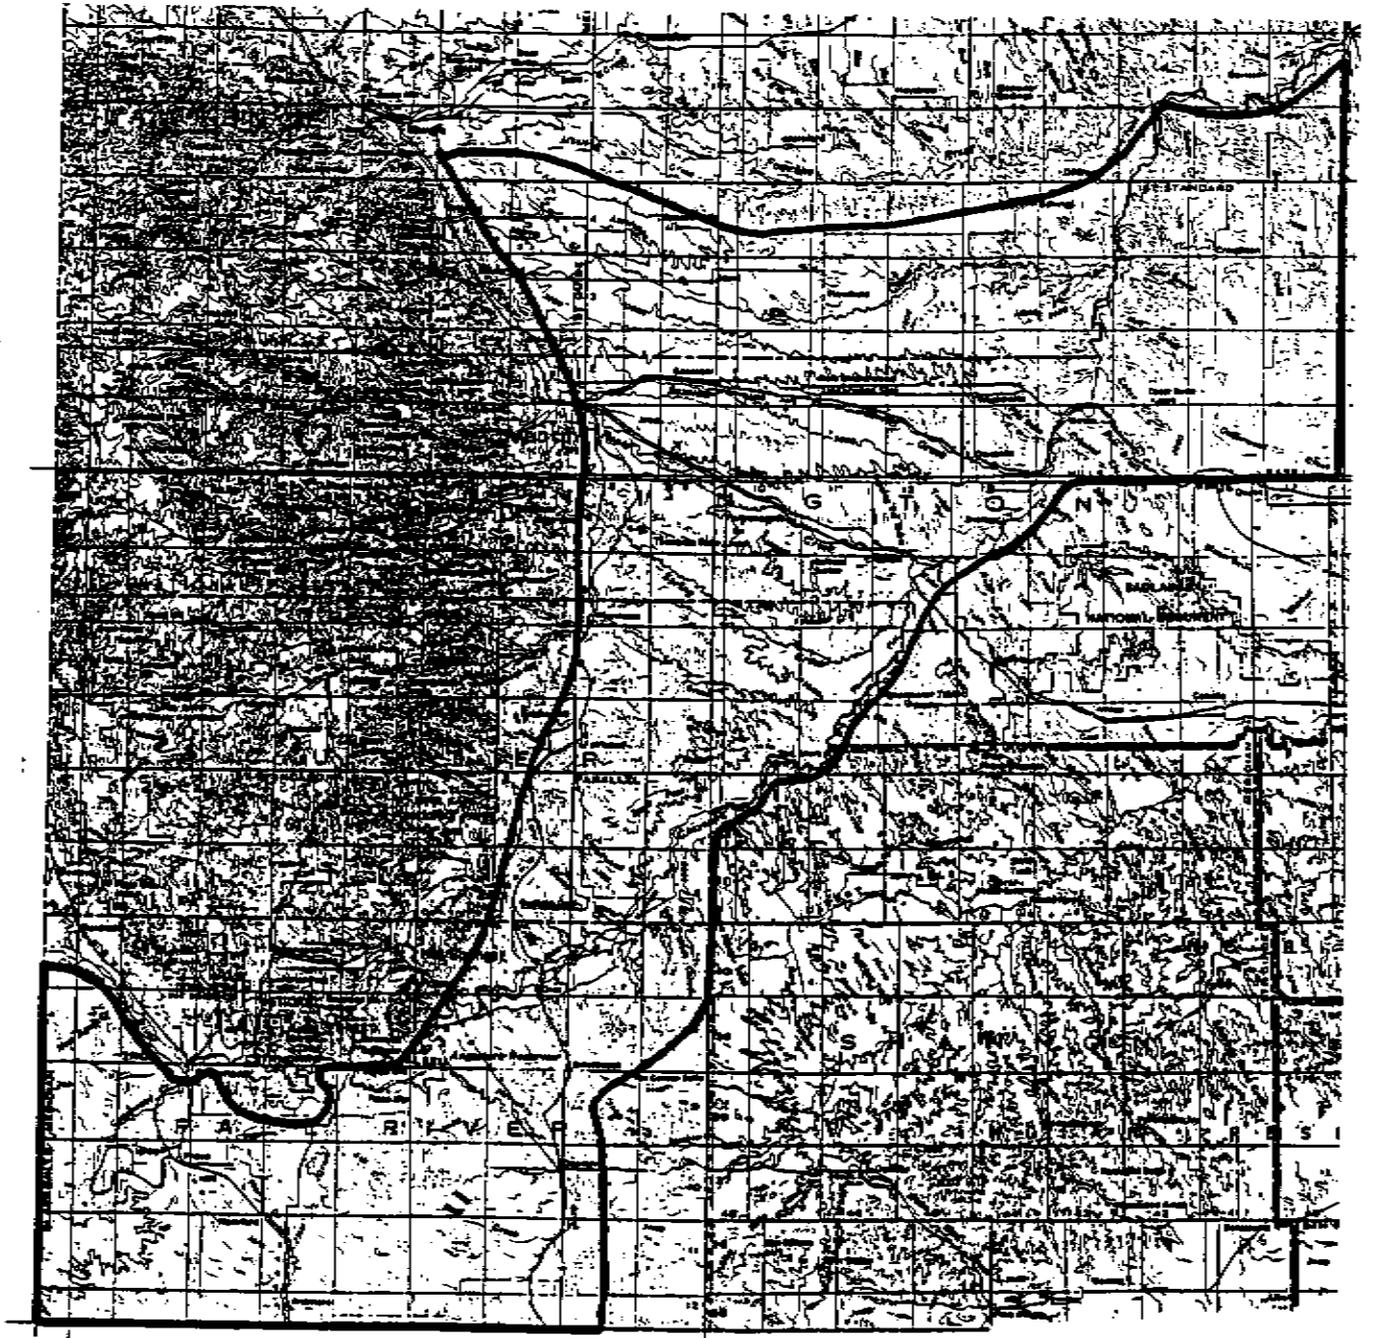

URBAN DEVELOPMENT: Historic towns of Teton, Wendt, Van Metre and Capa.

BAD RIVER BASIN DISCUSSION

Virtually nothing is known about the archaeological resources of the Bad River Basin Region. No resources had been recorded by 1977 (Alex and Zimmerman 1977) and no sites were reported in the Ft. Pierre National Grasslands in 1981 (Cassells and Agenbroad 1981). A few resources have been recorded since 1977 by small-scale reconnaissance surveys, but none have involved test excavations.

The primary research goal for the region calls for inventory and basic data collection.

SOUTH FORK CHEYENNE

SOUTH FORK CHEYENNE

ARCHAEOLOGICAL REGION #5

SETTING

The South Fork Cheyenne Region encompasses the South Fork of the Cheyenne River drainage basin in the southwestern portion of South Dakota with the exception of the Black Hills, southeastern Pennington County, and Shannon County. This area comprises southeastern Meade County, and portions of Pennington, Custer, and Fall River counties. Physiographically, the region is part of the Pierre Hills Section of the Missouri Plateau of the Great Plains (Rothrock 1943) and also part of the Southern Black Hills. The area is characterized by rolling grasslands broken by deeply-entrenched stream channels.

SUMMARY OF PREVIOUS ARCHAEOLOGICAL INVESTIGATIONS

This summary is drawn largely from Nowak and Hannus (1983). The first systematic archaeological surveys in the region were conducted by the RBS as part of the pre-inundation research for the proposed Angostura Reservoir. These surveys recorded 66 sites in the Cheyenne River drainage basin. The majority of the sites were listed as prehistoric habitation sites (Bauxer 1947; Hughes 1949). In 1948, Hughes and Shippee tested 13 sites, including the Ray Long site (39FA65), a Paleoindian campsite which yielded a radiocarbon date of 9380 ± 500 years B.P. (Hughes and White n.d.). In 1949, Hughes and later Richard Wheeler (n.d.a), investigated 12 additional sites and reexamined two from the previous field season. Wheeler's compilation of the notes from these excavations has not been published.

In 1974, the State Archaeological Research Center conducted extensive surveys along portions of the South Fork of the Cheyenne River in Fall River and Custer counties (Sigstad and Jolley 1975). This research was conducted in advance of uranium exploration projects proposed by the Tennessee Valley Authority. Also in 1974, an archaeological survey of selected portions of the Buffalo Gap National Grasslands was conducted (Kay 1974). The results of this survey and additional research in the Buffalo Gap National Grasslands are summarized in an overview of the resources of the Nebraska National Forest (Cassells and Agenbroad 1981). In 1980, a limited archaeological inventory survey was conducted along portions of the South Fork of the Cheyenne River by the Archeology Laboratory of South Dakota State University (Hannus et al. 1983). In 1982, Haberman

(1982) reported a buried, multicomponent site along Hat Creek (Danks site, 39FA756); the site was subsequently tested (Haug 1982a). Haug confirmed the presence of a buried paleosol but could not locate diagnostic materials to date the cultural components. Since the early 1970s, numerous small-scale contract surveys have contributed to the region's data base (Buechler 1986c, 1987h, 1987l, 1988d, 1989c). In 1985, an additional cultural resource inventory was conducted at Angostura (Haug et al. 1987).

HISTORIC CONTEXTS

PALEOINDIAN: No Clovis or Folsom complex sites have been recorded within the region; however, Clovis materials have been excavated in areas adjacent to the region at the Sheaman site in Wyoming (Frison 1982a), and at the Lange/Ferguson site in the White River Badlands of South Dakota (Hannus 1980, 1981, 1982, 1985, 1986a, 1988, 1990a, 1990b). Similarly, Folsom materials have been recovered in a cultural context at the Agate Basin site in Wyoming just a few hundred yards west of the Wyoming-South Dakota border (Frison 1982b).

CLOVIS.

FOLSOM.

PLANO. Plano complex materials have been recorded within the region. The most noteworthy locale assigned to this temporal/cultural affiliation is the Ray Long site (39FA65), excavated by RBS personnel prior to the construction of Angostura Reservoir. The Long site has become the type site for the Angostura projectile point. Tratebas (1979b) emphasized that the Angostura points have never been adequately described; but recent work has rectified this situation (Hannus 1986b) and provided additional data on the cultural components at this site. The Angostura point type is characterized by a lanceolate, unfluted blade exhibiting parallel-oblique flaking patterns. Two components (Components B and C) at the Long site contained Angostura points as well as unprepared hearths. Component B also yielded grinding slabs, manos, and transverse scrapers which Wheeler (n.d.b) interpreted as representing a campsite of hunters and gatherers. Component C contained a graver and three chipping stations defined by clusters of thin quartzite flakes, suggesting a shift in subsistence strategies. Hughes (1949) also reports a Plainview type point from the Long site. Hannus (1986b) obtained radiocarbon dates ranging from 11,000±310 B.P. to 8950±140 B.P., indicating the possibility of an earlier cultural surface than was observed during the RBS excavations. Nowak and Hannus (1983) also identify two Paleoindian sites in the region.

EARLY ARCHAIC:

HAWKEN. A projectile point fragment is described as "Hawken-like" by Nowak and Hannus (1983). It was recovered as part of a surface collection and is not in a cultural context.

MIDDLE ARCHAIC:

MCKEAN/DUNCAN/HANNA. Wheeler (n.d.a) has identified projectile points from the Kolterman, Harney, and Landers sites which Tratebas (1981) has assigned to the McKean complex along with Component A of the Ray Long site (the only published report of a McKean complex site being tested within this region).

YONKEE. Nowak and Hannus (1983) have identified one site within the region as having a Yonkee point type.

LATE ARCHAIC: Late Plains Archaic materials are frequently found in the Black Hills and some materials have been recorded on small-scale surveys in the region, but no sites have been tested.

PELICAN LAKE. Although Late Plains Archaic materials are frequently found in the Black Hills, especially Pelican Lake point types, few are reported in the South Fork Cheyenne Region. Nowak and Hannus (1983) list one site as yielding a late Pelican Lake projectile point.

LATE PREHISTORIC: A large number of sites within the South Fork Cheyenne Region have been assigned to the Late Prehistoric period based on the presence of small side-notched projectile points. Again, the majority of this site information is based on surface reconnaissance data.

AVONLEA. Tratebas (1979b) suggests that one site tested at the Angostura Reservoir by RBS crews contained a probable Avonlea phase point.

WOODLAND: Wheeler (n.d.a) reports finding Woodland materials at Angostura Reservoir and Sigstad and Jolley (1975) report Woodland-like projectile points in the area. Tratebas (1979a) discusses the problem of accurately differentiating Woodland period point types from Late Plains Archaic and early Late Prehistoric materials.

PLAINS VILLAGE: Plains Village period-like materials have been reported from the Phelps site (Alex and Zimmerman 1977) and from a site tested at Angostura Reservoir (Alex 1981a). Ceramics have also been reported from the Box Elder site (39PN200), but excavations at the site indicated that much of the site had been lost to natural and cultural disturbances and few artifacts were found in a cultural context.

PROTOHISTORIC/CONTACT PERIOD: Cassells and Agenbroad (1981) list a number of documented and undocumented historic resources within the Buffalo Gap National Grasslands.

HISTORIC EURO-AMERICAN:

EARLY COMMERCIAL EXPLOITATION AND MILITARY PRESENCE.

FUR TRADING POSTS: The Rapid Creek (Ogallalla) Post, located near the confluence of Rapid Creek and the Cheyenne River, is well-known to local historians but the exact location of the site is uncertain.

TRAILS: The two major historic trails known to cross the region are the Cheyenne to Deadwood trail and the Sidney to Deadwood trail.

OTHER EURO-AMERICAN.

FARM AND RANCH: Early cattle ranching operations include the S&G Ranch, an Anglo-American operation thought to be operating in the area as early as 1873.

SOUTH FORK CHEYENNE DISCUSSION

The region has been occupied since the late Pleistocene and in particular has the potential to address Late Plains Archaic cultural processes and Woodland and Plains Village utilization. Much work is also needed to delineate and define the protohistoric and historic resources of the region.

A major research goal for the South Fork Cheyenne Region entails basic inventory/data collections for areas immediately outside the Black Hills, especially along ancillary drainages.

BELLE FOURCHE

ARCHAEOLOGICAL REGION #6

SETTING

The Belle Fourche Region consists of the Belle Fourche drainage basin, north of the Hogback Ridge of the Black Hills. This area encompasses portions of Butte and Meade counties. Physiographically, the region is part of the Pierre Hills Section of the Missouri Plateau of the Great Plains (Rothrock 1943). The area is characterized by rolling grasslands broken by an occasional high isolated butte.

SUMMARY OF PREVIOUS ARCHAEOLOGICAL INVESTIGATIONS

Little professional research has been conducted in the Belle Fourche Region. A compilation of recorded sites in 1977 listed only two sites in Butte County and 33 sites in Meade County, with the majority of the Meade County sites being identified in the Black Hills (Alex and Zimmerman 1977). Prior to 1984, the majority of known resources had been recorded during the course of small-scale contract projects. In 1984, the State Archaeological Research Center began an intensive inventory of the Belle Fourche River valley (Keller and Keller 1984b; Keller, Keller and Miller 1985; Keller and Kurtz 1987; Kurtz and Keller 1986) as well as an inspection of private collections in Butte County.

HISTORIC CONTEXTS (Excluding Belle Fourche River valley survey results 1984-1987)

PLAINS VILLAGE: Two ceramic-bearing sites (39BU2; 39MD133), located in the Belle Fourche River valley, have received professional attention, with the incorporation of field school students and interested amateurs in the research activities. 39BU2 is a shallow, fortified site that has produced large assemblages of bone and lithic materials. The ceramics from the site have not been assigned to a specific typological category but appear to most closely resemble early Plains Village period materials associated with IMM variant sites (L. Alex 1979c, 1989). Radiometric assays cluster near 1000 years B.P. Limited test excavations at 39MD133 were conducted in 1984.

INITIAL MIDDLE MISSOURI.

PROTOHISTORIC/CONTACT PERIOD:

HISTORIC EURO-AMERICAN:

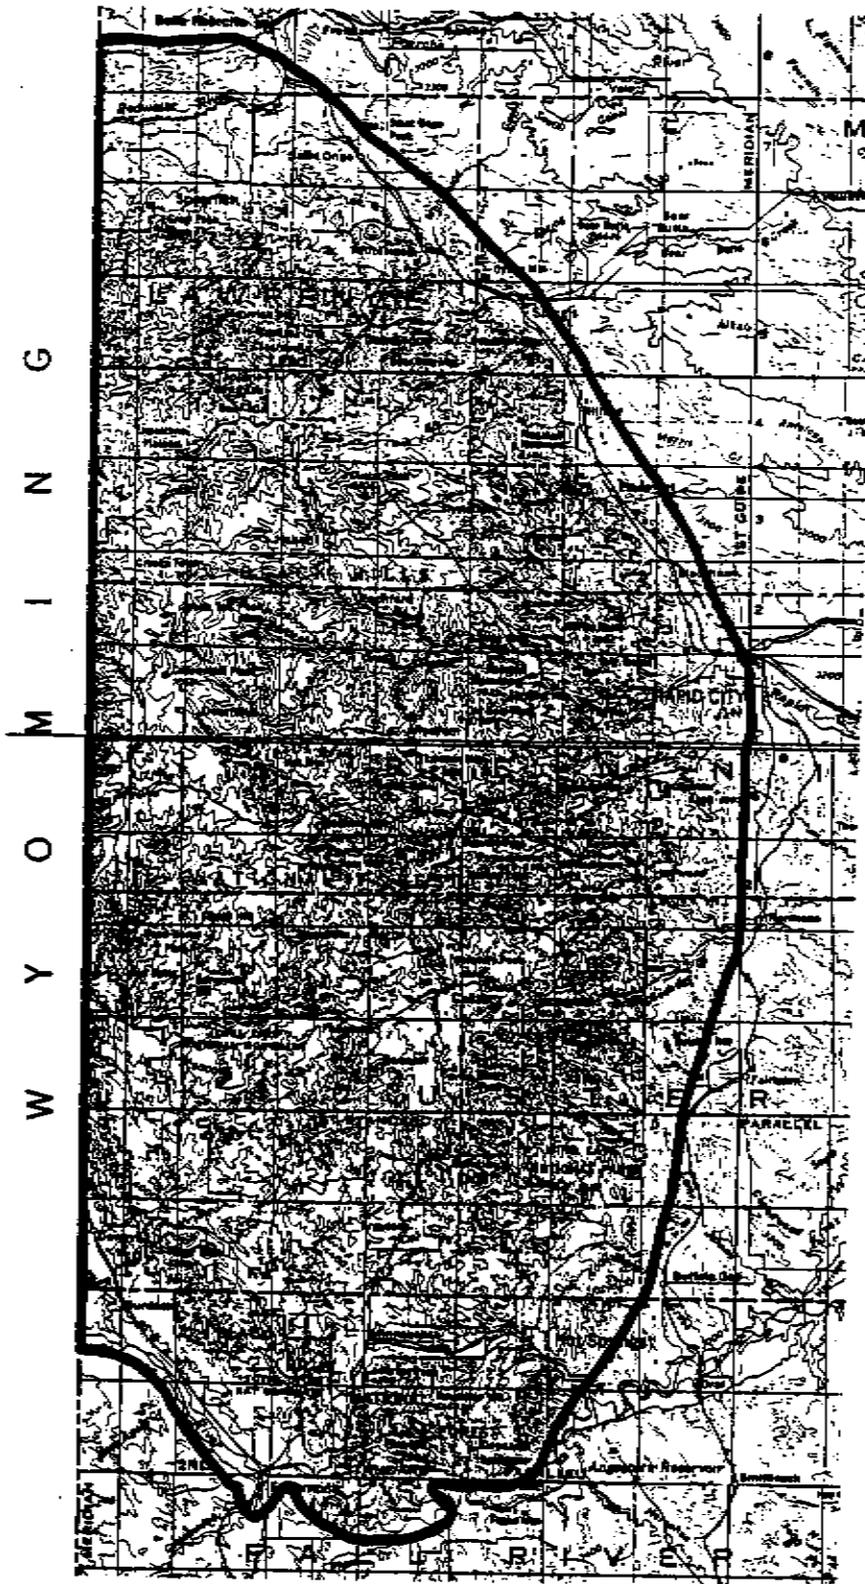

EARLY COMMERCIAL EXPLOITATION AND MILITARY PRESENCE.

TRAILS: The Bismarck to Deadwood trail crosses this region (Holst 1983).

BELLE FOURCHE DISCUSSION

The primary goal for this region calls for basic inventory and data collection. The area has the potential to examine Plains Village period utilization/exploitation, as well as resource utilization of the Black Hills periphery.

BLACK HILLS

BLACK HILLS

ARCHAEOLOGICAL REGION #7

SETTING

The Black Hills Region is located in western South Dakota. The eastern border of the region conforms to the Greenhorn limestone geologic formation. The northern edge of the region is drawn from the Greenhorn formation at the Butte-Meade County line, west to the base of the Hogback Ridge. The boundary then follows the Hogback Ridge west to the South Dakota-Wyoming border. The southern border of the region arbitrarily includes the area north of the Cheyenne River to the intersection of the Greenhorn formation in northeastern Fall River County. Small areas of the Hogback Ridge south of the Cheyenne River are also included in the Black Hills Region. Portions of Fall River, Custer, Pennington, Meade, and Butte counties and all of Lawrence County are included in the region.

The Black Hills are an isolated, unglaciated, domal uplift that rise above the surrounding plains along the South Dakota-Wyoming border. There are four major components of Black Hills topography. These components, from oldest to youngest and from the center outward, include the Central Area, the Limestone Plateau, the Red Valley, and the Hogback Ridge. Principal vegetation of the region consists of ponderosa pine, spruce, and a variety of grasses and forbs.

SUMMARY OF PREVIOUS ARCHAEOLOGICAL INVESTIGATIONS

Archaeological research was conducted in the Black Hills of South Dakota on an occasional basis from the early 1920s through the early 1970s. Since the 1970s, a large number of professional and paraprofessional studies have been conducted, primarily through the efforts of the Black Hills National Forest, Custer, South Dakota. This brief overview will focus on major professional research efforts in the area. A comprehensive overview of the cultural resources of the Black Hills National Forest has been published (Cassells et al. 1984). This overview is currently being updated to include the entire Black Hills Archaeological Region (Lance Rom, personal communication 1990). Other recent references include Tratebas (1986) and Sundstrom (1989b).

The efforts of W.H. Over and the staff at the USDM provide the basis for much of the early research into the Black Hills Region. Over investigated a number of sites in the southern Black Hills, including the

Flint Hills Quarry (1924), and petroglyph panels in Red and Craven canyons (1941). A compilation of Over's field notes indicates he also visited sites throughout the Black Hills (Sigstad and Sigstad, eds. 1973). During this period, Meleen and Pruitt (1941) excavated a number of rockshelters in the southern Black Hills for the USDM. World War II and the post-war era reservoir construction along the Missouri River interrupted Museum research efforts in the Black Hills until 1960. In 1960, Wesley R. Hurt directed the Sturgis Archaeological Project which conducted a reconnaissance survey of the interstate highway right-of-way from Tilford to the Wyoming state line (Gant and Hurt 1965; Hurt 1960a). This survey identified 35 archaeological sites in the northern Red Valley. Unfortunately, a comprehensive report was never published and the field notes have been lost. A part of the Sturgis Archaeological Project included test excavations at the Gant site, located northeast of Sturgis. The Gant site provided information critical to an understanding of McKean complex populations in the northwestern Plains (Gant and Hurt 1965; Hurt 1960a, 1960b, 1961).

From the late 1940s through the early 1950s, RBS crews were conducting survey and excavation research in the vicinity of Angostura Reservoir. Although this area is not included in the Black Hills Region, RBS research at Angostura Reservoir (see South Fork Cheyenne Region) is considered relevant to the prehistory of the Black Hills.

RBS research within the Black Hills Region was conducted at Deerfield Reservoir (Cooper 1947a) and in the Cottonwood Springs Reservoir area in the southern Black Hills (Mallory 1967). Later research was also undertaken for the USACE at Cottonwood Springs Reservoir and at Cold Brook Reservoir by Haug (1976a) and Weston (1982), respectively.

In the mid-1970s, systematic, intensive archaeological surveys were accepted as part of the cultural resources management (CRM) program for the Black Hills National Forest. The mid-1970s also saw a dramatic increase in mineral exploration and highway construction, especially in the southern Black Hills. Major reports summarizing some of the research and CRM projects since the mid-1970s include Buechler (1985c, 1985e, 1986b, 1986c, 1987a, 1987c-1987g, 1987i-1987k, 1988a-1988c, 1988g, 1988h, 1989d); N. Chevance (1979); T. Chevance (1985); Church, Chevance and Malone (1985); Church and Martin (1985); Haug (1976b, 1977a, 1978a, 1978b, 1979a, 1982c, 1984); Haug et al. (1980, 1987); Hovde (1980, 1981); Reher (1982); Rom (1984); Sigstad and Jolley (1975); and Tratebas (1982).

Non-Forest Service, federally-sponsored research within the Black Hills Region, other than those projects listed above, includes projects for the National Park Service at Mt. Rushmore National

Memorial (Anderson 1974) and Wind Cave National Park (Sudderth 1964), and for the Bureau of Reclamation in the Deerfield Reservoir vicinity (Buechler et al. 1984; Tratebas 1976a).

A bibliography of cultural resource survey reports by the U.S. Forest Service lists over 800 reports prepared between 1985 and 1989. Many of these publications report the results of small-scale surveys which recorded few or no sites. Several reports address specific sites and many are National Register evaluations (e.g., Brooks 1987a-1987i, 1988a-1988h; Brooks and Kurt 1987; Buechler 1988i; Cassells 1989; Caywood, Catton and Newell 1988; Chaplin and Chevance 1988; N. Chevance 1985b-1985f, 1986c-1986e; T. Chevance 1986a-1986f, 1987a, 1987b, 1988a-1988k, 1989a-1989e; Church 1985b, 1986a, 1986b, 1987a-1987r, 1988; Church and Church 1987a, 1987b; Dandridge 1988a-1988c, 1989a-1989c; Flemmer 1989a-1989e; Gallagher 1989; Geiger 1986; C. L. Gleichman 1987a, 1987b; P. Gleichman 1988a, 1988b; P. Gleichman and C. L. Gleichman 1987a, 1987b; Hamilton, Rom and Michaels 1985; Haug 1987a, 1987b; Hawthorne and Chevance 1986; Lindstrom and Chevance 1989; Miller 1986a-1986c, 1988a, 1988b; Noisat 1988a-1988e, 1989a-1989e; Rom 1985a, 1985b, 1986a-1986f, 1987a-1987d, 1988, 1989; Rom and Chevance 1985a, 1985b; Rom and Lindstrom 1986; Rosenberg 1985; Scott 1988; Shelly 1986, 1987a, 1987b; Tratebas 1985a, 1985b; and Weinberg-Tovar 1989).

HISTORIC CONTEXTS

PALEOINDIAN: There are no recorded sites in the Black Hills Region that contain Clovis or Folsom complex materials in a cultural context. It should be noted that extensive Clovis and Folsom materials have been excavated in the Agate Basin vicinity of Wyoming, only a few hundred yards west of the Black Hills Region (Frison and Stanford 1982).

The few Paleoindian sites that have been excavated in the Black Hills suggest Paleoindian materials are not deeply-buried. Tratebas and Vagstad (1979) contend that site distribution and density information suggests a cluster of late Paleoindian sites south of the Deerfield Reservoir area.

CLOVIS.

FOLSOM. Folsom projectile points have been reported in surface collections made by amateurs in the Black Hills; however, these reports have not been documented.

PLANO. Sites containing Plano complex materials have been reported by Buechler et al. (1984); Cassells (1981); Eckles (1978a); Haug (1977a, 1978a, 1978b); Haug et al. (1980); Sudderth (1964);

Tratebas (1977); and Tratebas and Vagstad (1979). The majority of this data comes from surface collections.

EARLY ARCHAIC: Few Early Plains Archaic sites have been positively identified in the Black Hills of South Dakota (Sundstrom 1989b:44-45). Tratebas and Vagstad (1979) discuss four sites, two in the central Black Hills, and two in the southern Black Hills, which were tentatively considered Early Plains Archaic; however, research by Haug et al. (1980) on the southern sites failed to support this contention. Research at the Hawken site, located in the northeastern Black Hills of Wyoming, suggests the Black Hills and immediate environs likely provided an attractive locality for Early Plains Archaic populations (Frison et al. 1976).

MIDDLE ARCHAIC: Considerable information is available regarding Middle Plains Archaic occupation of the Black Hills. Projectile point types from this period are assigned to the McKean complex; McKean lanceolate, Duncan, and Hanna styles are most abundant in the region.

MCKEAN/DUNCAN/HANNA. McKean complex materials have been recorded by Buechler et al. (1984); Cassells (1981); Chevance (1979); Eckles (1978a); Gant and Hurt (1965); Groenfeldt (1978); Haberman (1978); Haug (1978a); Haug et al. (1980); Popelish (1978); Sigstad and Jolley (1975); Tratebas (1977, 1978, 1979a, 1979b); Tratebas and Vagstad (1979); and Wichman (1978a). Despite the relatively large number of sites which have yielded McKean complex materials, only a few of these sites have been excavated; thus, a comprehensive interpretation of Middle Plains Archaic period utilization of the region is limited.

Tratebas (1981) has suggested a number of research topics dealing with the McKean complex in South Dakota (see also **ROCK ART** and **STONE CIRCLES** below).

LATE ARCHAIC: Cultural remains representing the Late Plains Archaic period are generally characterized by a variety of large, corner-notched projectile point types, followed by weakly barbed, side-notched types. Hovde (1981d) reports stone circle sites associated with Late Archaic populations.

PELICAN LAKE. The earliest Late Plains Archaic materials in the Black Hills are associated with corner-notched Pelican Lake phase points. Corner-notched points are found throughout the Hills (e.g., Buechler et al 1984; Chevance 1979; Haug 1978b; Haug et al. 1980; Sigstad and Jolley 1975; and Tratebas 1978).

LATE PREHISTORIC: Small corner and side-notched Late Prehistoric points are found throughout the Black Hills, although they are less common than Middle or Late Plains Archaic materials (Tratebas 1979a). Radiocarbon dates from the Deerfield site

(39PN214) suggest a more intensive Late Prehistoric period utilization of the central Black Hills than was previously thought (Buechler et al. 1984). Also see BISON JUMP, below.

AVONLEA. Only a few sites have produced artifacts recognized as Avonlea points (Haug 1978b; Wheeler n.d.a).

WOODLAND: Woodland-like projectile points are reported in the southern Black Hills by Sigstad and Joiley (1975) and by Haug (1978b). Tratebas (1979a) discusses the problems of differentiating between Woodland points and materials from the Late Plains Archaic and early Late Prehistoric periods.

BESANT. Large side-notched points assigned to the Besant phase are not common in the Black Hills. Buechler (1984b), Eckles (1978b), Tratebas (1979a), and Wichman (1978b) have reported large, side-notched projectile points recovered from surface collections.

PREHISTORIC THEMATIC:

ROCK ART. Sundstrom (1984, 1989a) suggests the earliest rock art in the southern Black Hills may date to 2500 B.C.

PETROGLYPHS.

PREHISTORIC QUARRIES. Cabot Hill quarry (39PN658) (Butterbrodt and Winham 1984).

LITHIC PROCUREMENT TECHNIQUES.

STONE CIRCLES. Hovde (1980) reports stone circles in association with McKean complex artifacts along the eastern periphery of the Black Hills.

BISON JUMP. The Vore site, located in the Black Hills of Wyoming, contained extensive, multiple Late Prehistoric period components associated with a bison jump and kill site (Reher and Frison 1980). The Sanson Buffalo Jump, 39CU2, is also recorded.

SACRED SITES. Sacred sites in the vicinity are Bear Butte, Inyan Kara, Sundance Mountain, and Devil's Tower.

PROTOHISTORIC/CONTACT PERIOD: The Protohistoric period is poorly understood in the Black Hills. Eckles (1978b) reports a possible metal projectile point and Sudderth (1964) reports having observed a metal projectile point in the Sanson collection. Tratebas (1979a) has reported a sweatlodge structure, and Anderson (1974) identifies structures in a rock overhang with the Protohistoric period. Radiocarbon dates from the Deerfield site also suggest protohistoric utilization of the area (Buechler et al. 1984).

HISTORIC NATIVE AMERICAN TRIBES. Ethnohistoric and historical accounts suggest a variety of tribal groups occupied or utilized the Black Hills Region during the Protohistoric and Historic

periods. However, no Black Hills archaeological site has been assigned to a specific tribal group.

HISTORIC EURO-AMERICAN: Non-Indian intrusions into the Black Hills were made by trappers, traders, miners, and scientific and military expeditions dating to the 1800s. The first official reconnaissance of the Black Hills interior occurred during the Custer Expedition of 1874. Other parties, most notably the Harney Expedition of 1855 and the Warren Expedition of 1857, had previously traversed the periphery of the Black Hills.

Custer's scientific and military expedition was organized to find a route into and explore the Black Hills. Earlier reports by trappers and traders indicated that gold was available from the Black Hills. Custer's Expedition confirmed this rumor, which then led to the gold rush of the late 1870s. A number of private parties organized gold-seeking expeditions before settlements were reached with Sioux Indians. Among these early parties was the Gordon Party from Sioux City who established the Gordon Stockade in 1874-1875. Increasing pressure to open the Black Hills to white settlement led the government to commission the Jenney Expedition of 1875 to appraise the resources of the region.

Conclusion of the Black Hills Agreement of 1876 paved the way for white development of the region. Miners and prospectors traveled to the region in huge numbers. Prospecting trenches are found in the most remote gulches of the Black Hills. The development of numerous mining camps and towns proceeded at a rapid rate. In 1879, Camp Collier, a military post, was established at the mouth of Red Canyon to protect the Cheyenne to Deadwood stage line. Early prospecting activities were focused in the Custer area of the southern Black Hills. Later discoveries in the Deadwood-Lead area of the northern Black Hills led to the abandonment of prospecting activities in the south. The impact of mining activities and resulting support industries, such as transportation routes and lumber and food production, on the archaeological resources of the region are not well-understood. Few historic archaeological studies have been conducted in the area (e.g., McKay 1976).

EARLY COMMERCIAL EXPLOITATION AND MILITARY PRESENCE.

FUR TRADING POSTS:

FORTS: Camp Collier, Camp Sturgis, and Ft. Meade are in the vicinity.

TRAILS: Stage stations and trails in the area.

PERMANENT RURAL AND URBAN PIONEER SETTLEMENT.

MINING:

RAILROAD:
OTHER EURO-AMERICAN.

CLAIM STRUCTURES:

ETHNIC ENCLAVES: Ethnic mining groups (Chinese, Finns).

FARM AND RANCH: S&G ranch.

INDUSTRIAL STRUCTURES:

TRANSPORTATION STRUCTURES:

RELIGIOUS STRUCTURES:

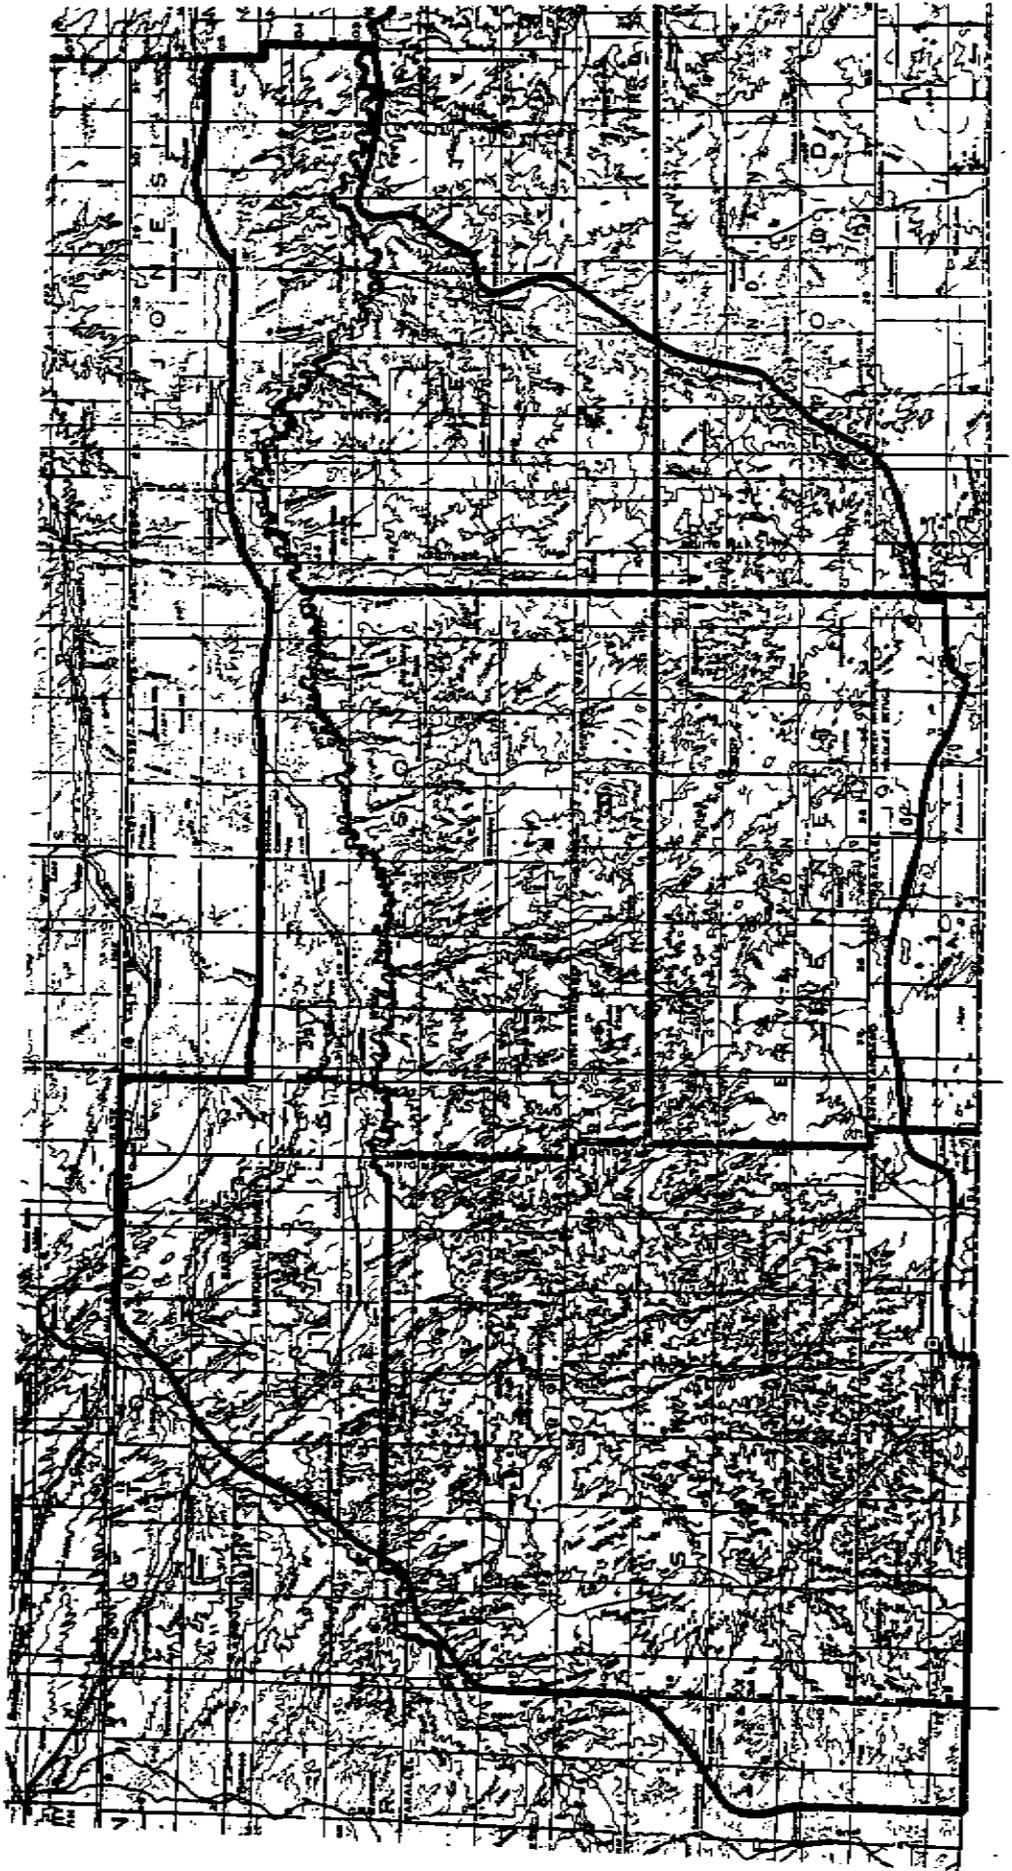

BLACK HILLS DISCUSSION

General data for most temporal/cultural periods are better documented for the Black Hills Region than for many of the archaeological regions in South Dakota. However, much of the data is generated from surface collections and additional research is necessary for all aspects of the archaeological resources. Research is also needed to determine what effects 120 years of mining have had on the prehistoric data base. Additionally, detailed examination of seasonal exploitation of the Black Hills, especially in terms of grassland/forest resource exploitation is needed. The Black Hills played a unique role in the past, just as they do today.

Future research into the following contexts will likely yield significant insights into the region's past: Paleoindian utilization (Were Clovis or Folsom complex peoples utilizing the Black Hills and to what extent? What areas of the Black Hills were being utilized during different portions of the Paleoindian period?), McKean complex (a large number and variety of McKean complex sites are known to exist; is this indicative of population growth, shifting settlement and subsistence, or other factors?), lithic procurement, rock art, and protohistoric and historic occupation. What specific locations in the Black Hills do tribal groups presently consider sacred or ceremonial sites? What locations were considered sacred or ceremonial in the past? How do the Black Hills relate to the mythology of each tribal group that has inhabited the region?

Historic archaeological questions regarding mining sites (variations in stamp mill plans, extraction techniques, etc.), military outposts, military expeditions (Custer), scientific expeditions (Harney, Warren and Jenney), transportation routes (state stations, trails), early ranching, Indian religious sites, documentation of ethnic groups (Chinese), and the Depression are some of the topics that can be addressed in the Black Hills Region. There is also the potential for developing a dendrochronological sequence using historic log structures.

WHITE RIVER BADLANDS

WHITE RIVER BADLANDS

ARCHAEOLOGICAL REGION #8

SETTING

Physiographically, the White River Badlands (Figure 11.1) are part of the Tertiary Tablelands Section of the Missouri Plateau Division of the Great Plains Province. The badlands are characterized by "gleaming, light-colored rocks exposed in deeply-cut, small valleys amid crenelated peaks and castellated buttes" (Hannus and Nowak 1984). This unique topographic relief is a result of parallel slope retreat and associated landscape reduction. The White River Badlands Region encompasses all of Shannon and (the former) Washabaugh counties, and portions of Fall River, Pennington, Jackson, Bennett, Mellette and Todd counties. The eastern boundary is arbitrarily placed a mile along, and a mile to the east of, the Little White River.

SUMMARY OF PREVIOUS ARCHAEOLOGICAL INVESTIGATIONS

A detailed review of previous archaeological investigations in the White River Badlands Region was prepared by Nowak (1984a). Exploration of the White River Badlands Region, initially by fossil-hunting expeditions, began in the mid-nineteenth century. Perhaps the earliest reference to archaeological remains is Sheldon's 1905 report of the presence of seven ancient fire hearths along Lost Dog Creek, southeast of Interior. The first systematic archaeological investigations in southwestern South Dakota were initiated during the Missouri River Basin Surveys. In May of 1949, Wheeler examined a proposed dam and reservoir site on the White River in Shannon County in the vicinity of Rockyford. Wheeler recorded three sites, one of which (39SH1) he related to the Signal Butte II pre-ceramic complex, dating from 3000 to 4000 B.C.

In 1939, approximately 190 square miles of the White River Badlands were designated a National Monument. In 1953, Paul Beaubien of the National Park Service completed a reconnaissance level survey within the North Unit of the Monument to confirm and evaluate sites reported by Morris F. Skinner, a field associate with the Frick Laboratory, American Museum of Natural History, who had been collecting fossil materials. Beaubien recorded at least 30 sites which yielded ceramics, lithics and bone debris (Beaubien 1953). In 1958, Dee Taylor conducted salvage investigations within the Monument for the National Park Service. Taylor (1961) found little evidence for Paleoindian or Archaic period populations but did report Plains

Woodland or Plains Village tradition materials.

Throughout the 1970s and 1980s, a series of small to medium-scale surveys and excavations have been carried out resulting in the location of over 590 sites in this region. In 1972, Sigstad surveyed a portion of Highway 44 in the badlands for the South Dakota Department of Transportation. Two sites were recorded and subsequently tested in 1975 (Sigstad and Luoma n.d.). In 1974, a reconnaissance survey within the Buffalo Gap National Grasslands identified 18 sites (Kay 1974), and two hearths along Bear Creek were radiocarbon dated by the South Dakota Geological Survey. The lower hearth yielded a date of 780 ± 130 years B.P., and the upper feature provided a date of 2350 ± 180 years B.P. (Harksen 1974). The inconsistency of these dates was explained by gully erosion of the older strata and subsequent filling, during which time a later hearth was left in younger, but lower, soil strata of the extinct gully. In 1978, a crew led by Falk (Falk et al. 1978) recorded 27 sites during a survey of the proposed White River Development Area of the South Unit of the National Monument and Lincoln (1978) recorded 13 archaeological sites as part of a reconnaissance survey of the proposed Sage Creek Rim Road.

In 1980, L. Adrien Hannus began the first major archaeological work in the White River Badlands outside of the National Monument area with the excavation of the Lange/Ferguson site (39SH33), a Clovis mammoth kill/butchery locale (Hannus 1980, 1981, 1982, 1985, 1986a, 1988, 1990a, 1990b). The White River Badlands Regional Research Project was begun in 1981 under the supervision of L. Adrien Hannus and Timothy R. Nowak. This multi-year research project was initiated to investigate the archaeological resources of portions of the badlands that had received little professional attention, namely those areas outside of the National Monument. As part of this project, Nowak and Hannus (Nowak et al. 1984) investigated a lithic outcrop quarry and associated lithic scatter/workshop debris along West Horse Creek; Lueck and Butterbrodt (1984) reported on surveys in Jackson and Shannon counties; and Keller and Froelich (Keller et al. 1984) conducted test excavations along Pass Creek in Jackson County.

In 1982, SARC conducted reconnaissance surveys along a proposed section of the Highway 44 right-of-way, recording 58 archaeological, historic, or paleontological sites (Sundstrom and Malone 1982). Test excavations have been conducted at a number of these sites (Haberman et al. 1984; Rood et al. 1984). The White River Badlands Regional Research Project has also continued and surveys have been accomplished in Shannon, Pennington, Custer and Bennett counties (Hannus, Lueck and Winham 1986a; Hannus and Winham 1985). Les Ferguson, a native of the region and a longtime avocational

archaeologist, has been particularly helpful by taking professional archaeologists to numerous sites, such as eroding hearths, thereby verifying the assumption that a wealth of information still remains to be tapped.

A summary of surveys accomplished in the White River Badlands Region through 1988 is presented in Table 11.1. Figure 11.2 shows the major areas surveyed in the region, Figure 11.3 shows the distribution of sites, Figure 11.4 presents a graph showing the number of components by context in the White River Badlands Region, Figure 11.5 is a graph showing the number of prehistoric components by landform and Figure 11.6 shows the historic components by landform in the White River Badlands Region.

LANDFORMS

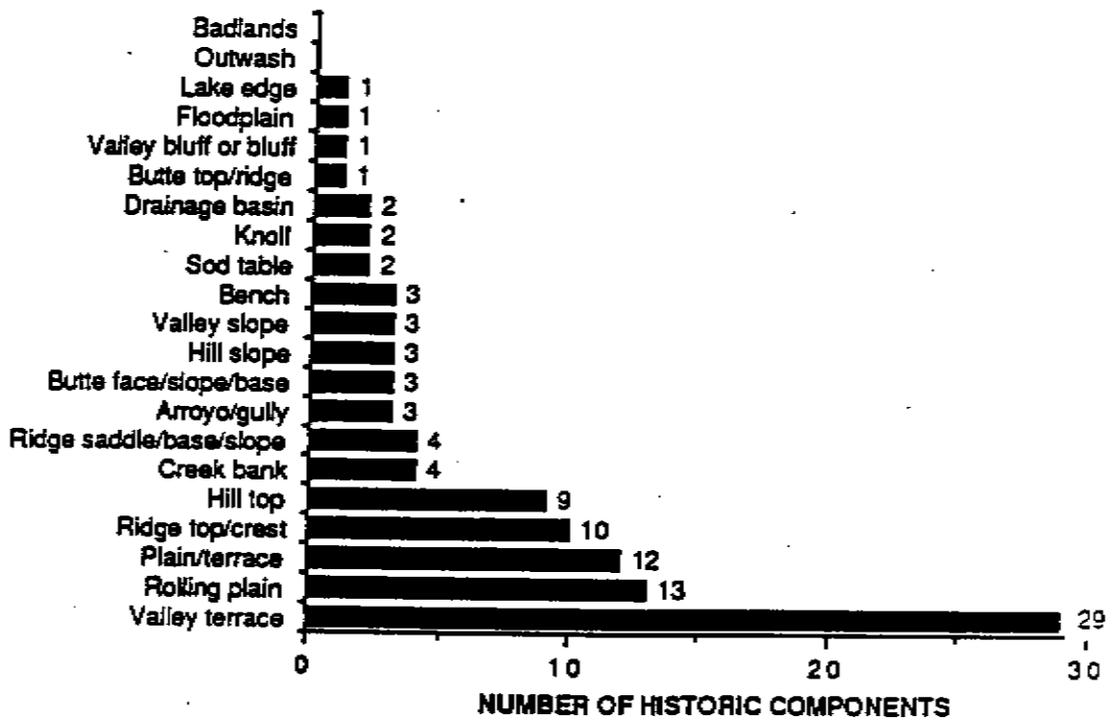

Figure 11.6. Graph showing the number of historic components by landform in the White River Badlands Region.

HISTORIC CONTEXTS

PALEOINDIAN:

CLOVIS. One Clovis locality (39SH33) is recorded in the region, the Lange/Ferguson site. This site is a mammoth kill/butchery locality that was extensively excavated in the early 1980s (Hannus 1980, 1981, 1982, 1985, 1986a, 1988, 1990a, 1990b). The site produced direct evidence for the use of mammoth bone tools in the butchering process. Two complete Clovis projectile points (reworked) and the basal portion of one Clovis point were recovered during excavation. The points are produced on chert, likely derived from White River cobbles/gravels. Clovis projectile points in private collections indicate that several other Clovis localities are present in the region.

One tertiary flake recovered from the Lange/Ferguson site is produced on a brown chalcedony, probably derived from the nearby West Horse Creek quarry (39SH37). The presence of this flake indicates the possibility that the quarry site was utilized during the Clovis period.

FOLSOM. The Folsom Spring site (39SH101), a deflated camp area associated with an ancient spring source, is the only recorded Folsom site in the region. Folsom projectile points in private collections indicate the presence of additional Folsom sites.

PLANO.

AGATE BASIN: Five sites are recorded at which Agate Basin points have been recovered. These sites vary from an isolated point to a multicomponent locality.

ALBERTA: An isolated Alberta-like point is recorded at site 39SH85.

UNASSIGNED PALEOINDIAN. Four sites have produced lanceolate projectile points/possible Paleoindian point fragments. One site, 39PN5, is recorded as being "similar to a Plainview type" (Taylor 1961:80).

Late Paleoindian materials are commonly reported in surface collections made by amateurs in the region; however, the locations of these sites have not been confirmed (e.g., Sigstad 1973a).

EARLY ARCHAIC:

UNASSIGNED. Two sites with Early Plains Archaic projectile points (39JK100 and 39SH54) are recorded. The latter site is assigned to the Early Plains Archaic Side-Notched cultural/temporal complex (Hannus et al. 1989:176).

MIDDLE ARCHAIC:

OXBOW. Site 39SH74 is an outwashed hearth with flaking debris and a partial side-notched Oxbow point (Hannus et al. 1989:160).

MCKEAN. Seven sites have been assigned to the McKean complex. Most of these sites are multicomponent, deflated campsites.

DUNCAN/HANNA/YONKEE. Eight sites have produced projectile points assigned to either Duncan/Hanna or Yonkee types. Most of these sites are part of multicomponent deflated campsites.

UNASSIGNED. Three sites are assigned generally to the Middle Archaic, including one investigated in 1948 (Wheeler 1949:2-3).

LATE ARCHAIC:

PELICAN LAKE. Twenty-one sites have been recorded which contain projectile points defined as Pelican Lake. At site 39PN607, a series of radiocarbon dates indicates a Late Prehistoric occupation, while the diagnostic points recovered are morphologically similar to Pelican Lake and Besant types (Rood et al. 1984:119-187). The earliest date from the site, A.D. 440±70, falls on the division between the Late Plains Archaic period and the Late Prehistoric period (Frison 1978).

UNASSIGNED. Ten sites have been assigned generally to the Late Archaic period based on radiocarbon dates or projectile point morphology. Again, many of these sites are part of multicomponent complexes.

LATE PREHISTORIC:

AVONLEA. Seven sites in the region have been assigned to the Avonlea cultural/techno complex. Site 39SH62 contained six projectile points (Hannus et al. 1989:99). Site 39SH72 contained an Avonlea (Timber Ridge Side-Notched variety) point and a ceramic rimsherd (Hannus et al. 1989:130).

UNASSIGNED. Sixty-seven sites have been generally assigned to the Late Prehistoric period. Of these sites, 24 are part of multicomponent localities. The majority of the sites are artifact scatters, but other site types are represented as follows: a possible bison kill (39JK3); a camp and bison jump/kill locality (39PN9, Pinnacles site); West Horse Creek quarry (39SH37); a quarry site for West Horse Creek chert/Scenic chalcedony (39SH81); and a burial (39SH117), radiocarbon dated to 1090±70 B.P. (Beta-14771).

WOODLAND:

Three sites are assigned generally to the Woodland period and two sites are described as Woodland or Plains Village (39JK111, 39JK119). Excavations at a multicomponent locality, the Berry Butte site (39JK63), were conducted in 1983 (Keller et al. 1984). Woodland ceramics were classified as Badlands Thick (Early Woodland) and Kadoka Cord-Imprinted (Middle Woodland) (Lueck and Butterbrodt 1984:48-50).

The Long John site, 39JK68, was partially excavated in 1983 (Keller et al. 1984) and a hearth was dated to 1200±130 B.P. (Teledyne Isotopes I-12,754). Fragments of two vessels, one globular with cord

impressed sherds and one conoidal with burnished sherds, were recovered.

BESANT. Fifteen sites have been recorded which contain Besant projectile points. Most of these sites are multicomponent localities.

PLAINS VILLAGE: Seventeen sites (excluding 39JK111 and 39JK119 discussed above) are described as belonging to the Plains Village period on the basis of ceramic materials. Several of these sites are considered to be IMM variant localities (e.g., 39JK4, the Johnny site; 39PN586; 39SH133), while others are associated with the Extended or PCC variants (e.g., 39PN590 and 39SH60). One site, 39SH111, is tentatively assigned to the IC variant (Church 1985a:30).

OTHER PREHISTORIC: A total of 386 unassigned prehistoric sites are reported from the White River Badlands Region.

PREHISTORIC THEMATIC:

STONE CIRCLES. Three stone circle sites are reported from the region: 39SH34, 39SH35 (see Anderson 1980) and 39SH40.

BISON JUMPS/IMPOUNDMENTS. Site 39SH76 is a bone bed associated with a presumed bison jump (Hannus et al. 1989:178-180), while site 39JK3 is recorded as a possible bison kill site (SARC site files). The Pinnacles site, 39PN9, is identified as a camp and bison kill/jump locality (Beaubien 1953:1-2).

ROCK CAIRNS. Site 39TD39 is described as a rock cairn which may be natural or associated with nearby trails (Haberman 1985c:38). Site 39TD35, a rock cairn located on a high knoll, is judged to be conceivably of historic Dakota cultural affiliation (Haberman 1985c:33).

LITHIC PROCUREMENT/QUARRIES. An extensive quarry area, the West Horse Creek quarry, 39SH37, was investigated in 1983 (Nowak et al. 1984) and appears to have been utilized from the Clovis period to the Historic period. Another quarry source for West Horse Creek chert is site 39SH81 from which Hanna and Pelican Lake points were recovered (Lueck and Butterbrodt 1984:17).

Site 39PN599 is recorded as a lithic procurement area where exposed Chadron cobbles were quarried (Rood et al. 1984:106-108). Many of the sites located during the Highway 44 project [Reach 2] (Rood et al. 1984) were identified as lithic procurement localities. These sites are located on gravel terraces where Chadron chert cobbles are exposed on the surface.

PROTOHISTORIC/CONTACT PERIOD:

HISTORIC NATIVE AMERICAN TRIBES.

SIoux: A number of sites relating to Sioux occupation of the area have been recorded in the region. Included among these sites are Lip's Camp (39JK84) and Cemetery (39JK58). Lip's Camp was occupied by the Wazhazha band of the Upper Brule Sioux from 1880-1904 (Lueck and Butterbrodt 1984:54). Cemetery Hill (39MT13) is the site of Sioux burials reported to be the graves of the Foolish Heart family (Rood 1984:9-10). Site 39PN2 is reported to be the campsite of Big Foot's band just prior to the slaughter at Wounded Knee in December, 1891 (Beaubien 1953:3).

Haberman (1985c) records a number of relatively recent historic Dakota occupation sites in Todd County. Major excavations have just been completed (Haberman, personal communication 1989) at Hollow Horn Bear Village (39TD32) where several depressions, a house mound and associated midden were identified. Hollow Horn Bear was a prominent Dakota leader during the late 1800s and early 1900s. He is historically associated with the site by an indication on the General Land Office Survey Map, but the historic features at the site are not necessarily associated with the occupation by Hollow Horn Bear (Haberman 1985c:29-31).

RESERVATIONS. The White River Badlands Region encompasses all of the Pine Ridge Indian Reservation and portions of the Rosebud Indian Reservation. The Pine Ridge Reservation was established in 1878 and the area has been occupied by the Oglala Sioux since that time (Kurtz 1988b:3-4).

HISTORIC EURO-AMERICAN:

EARLY COMMERCIAL EXPLOITATION AND MILITARY PRESENCE.

The first non-Indian expedition into the White River Badlands Region occurred in 1823 when the Jedediah Smith party passed through the Badlands, camping along the White River. Two early exploration parties to cross the region were those of Dr. John Evans (1849) and Lieutenant G. K. Warren (1855).

TRAILS: Furs were transported along the Ft. Laramie to Ft. Pierre pack trail which in part followed the White River and brought individuals involved with the industry into the Pine Ridge (Cassells and Agenbroad 1981:87-88). Jim Hanson, Museum of the Fur Trade at Chadron, Nebraska, has researched the Ft. Laramie to Ft. Pierre (Robinson) Trail.

BATTLE GROUNDS: Wounded Knee Battlefield is the site of the last armed conflict between Indians and United States government troops, fought on December 29, 1890 (Brown 1970:413-

420). The site is a National Historic Landmark but is not listed on the National Register of Historic Places.

PERMANENT RURAL AND URBAN PIONEER SETTLEMENT.

Seventy-four historic Euro-American sites have been recorded in the White River Badlands Region. The majority of these are artifact scatters, depressions and/or foundations, but the sites also include school remains (e.g., 39PN594); remains of transportation routes, such as railroad bridges (39JK31) and old wagon roads (39JK53); and cemeteries (e.g., 39JK51). Some of the sites appear to be homesteads (e.g., 39PN888), but little detailed research has been undertaken on their remains.

WHITE RIVER BADLANDS DISCUSSION

The White River Badlands Region has considerable research potential for examining the entire prehistoric and historic past, particularly in regard to Paleoindian and Archaic occupations. Although the latter sites are often deeply-buried, the unique erosional processes of the badlands area frequently expose early components in isolated buttes, sod tables or deeply-cut drainages. Due to depositional processes, cultural component separation is very good, thus providing an excellent source for developing radiometric temporal/cultural sequences.

It should be noted that the complex nature of these erosional and depositional processes requires a detailed understanding of geomorphological principles. The development of multidisciplinary studies incorporating geomorphologists or soil scientists and microfaunal/gastropod specialists would greatly benefit archaeological research in this region since many of the deeply-buried sites contain multiple archaeological components. The buried cultural strata contain microfaunal remains which can provide critical environmental data.

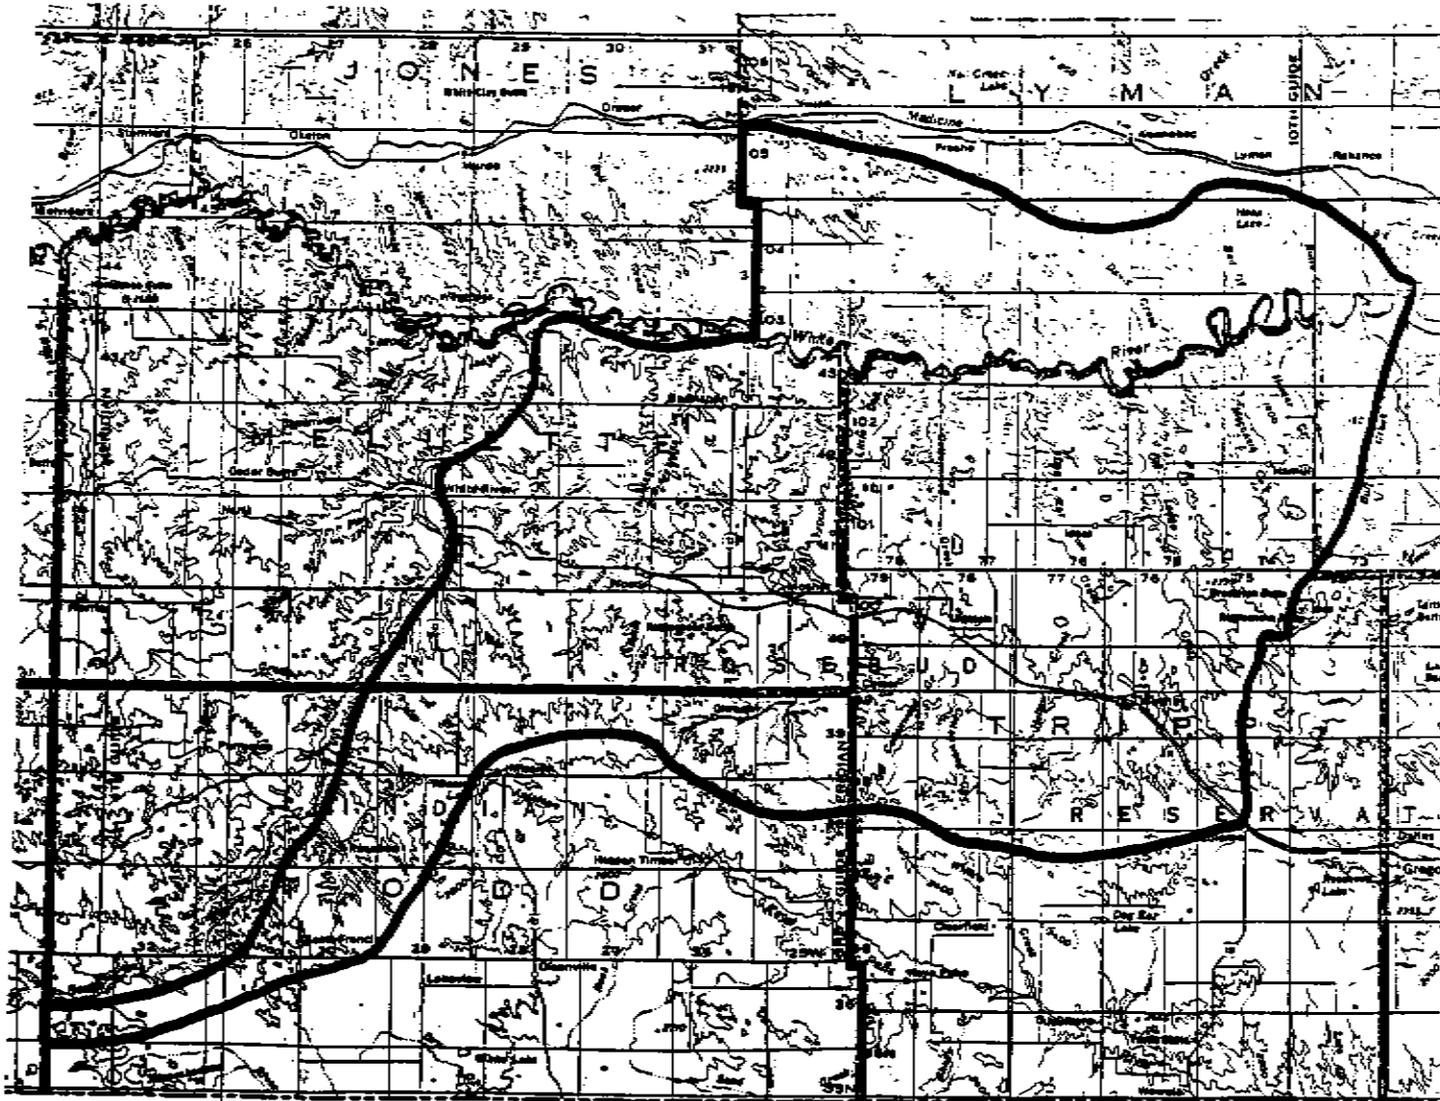

Research into lithic procurement (e.g., Ahler 1977a; Nowak and Hannus 1981; Nowak et al. 1984) and bone tool technology (e.g., Hannus 1985, 1990a) could be expanded.

Research into the protohistoric and historic periods can address historic Sioux adaptation to early reservation settlement; the identification and documentation of Sioux sacred sites; the development of early transportation routes such as the Ft. Pierre to Ft. Laramie Trail; and homestead and ranching activities. Early explorations of the Badlands region by scientific (e.g., Audubon, Prout, Culbertson, Evans, Meek and Hayden, Marsh) and early trading and military expeditions could also be investigated. Early geological and paleontological reports frequently mention the observation of

archaeological materials in the region (e.g., Barbour and Schultz 1936; MacClintock et al. 1936; Schultz 1938; Schultz and Stout 1934; and Sheldon 1905).

The distribution map showing areas surveyed clearly reflects a bias along the White River and areas to the north. There is a need to explore more of the drainages that extend south from the White River. Additionally, the area bordering the Sandhills might contain information pertinent to this ecozone. A majority of the sites recorded in this region remain unassigned to a temporal or cultural affiliation. With the availability of accelerator dating techniques, it should be possible for future researchers to obtain more absolute dates for sites.

LOWER WHITE

LOWER WHITE

ARCHAEOLOGICAL REGION #9

SETTING

The Lower White Region encompasses the White River drainage from the Little White River east to approximately the Tripp-Lyman, Tripp-Gregory County lines. This area includes portions of Mellette, Todd, Lyman, and Tripp counties in south-central South Dakota. Physiographically, the area is situated within the Pierre Hills of the Missouri Plateau division of the Great Plains province (Rothrock 1943). The general topography of the area consists of rolling, grass-covered hills.

SUMMARY OF PREVIOUS ARCHAEOLOGICAL INVESTIGATIONS

No major archaeological research has been conducted within the Lower White Region, and only a few small-scale contract surveys have been undertaken in the area. Perhaps the most notable work was conducted by W. H. Over (Sigstad and Sigstad, eds. 1973).

HISTORIC CONTEXTS

WOODLAND:

LATE WOODLAND. Over reported ceramics from Tripp(?) County that appear to be affiliated with a Late Woodland population.

PLAINS VILLAGE:

CENTRAL PLAINS. Over reported the only Central Plains tradition materials known in South Dakota from somewhere in this region, possibly from the Cottonwood Creek area south of Presho (Alex 1980a).

EXTENDED COALESCENT. Over (Sigstad and Sigstad, eds. 1973) recorded an extensive EC village along the White River. The Erickson site is located south of Presho in Lyman County.

PREHISTORIC THEMATIC:

SACRED SITES. Sioux sacred sites.

PROTOHISTORIC/CONTACT PERIOD:

RESERVATIONS. Rosebud Sioux Indian Reservation.

LOWER WHITE DISCUSSION

The primary need for this region is an expansion of the resource data base through basic inventory and data collection. The area has the potential to examine Plains Village utilization, and occupation of the area by Central Plains tradition populations. The identification and documentation of Sioux sacred sites and early reservation period sites are potential research topics.

SANDHILLS

SANDHILLS

ARCHAEOLOGICAL REGION #10

SETTING

The Sandhills Region encompasses portions of southern Bennett, Todd, Tripp, and Gregory counties. The area is characterized by rolling to gently rolling hills and sand dunes. It is the northernmost extension of the Nebraska Sandhills and is primarily drained by tributaries of the Niobrara River.

SUMMARY OF PREVIOUS ARCHAEOLOGICAL INVESTIGATIONS

The only systematic investigations of the Sandhills Region were conducted by T. W. Haberman and N. Chevance in 1984. This research consisted of survey and test excavations of the proposed realignment route of South Dakota Highway 18 through parts of the Rosebud Indian Reservation (Haberman 1985c). Beyond this research, only a few small-scale contract surveys have been conducted. Investigations undertaken immediately adjacent to the South Dakota-Nebraska state line (Nowak 1984b) can provide significant information for the South Dakota Sandhills.

HISTORIC CONTEXTS (Update with Highway 18 survey results)

LATE PREHISTORIC: There are unconfirmed reports of Late Prehistoric period sites in the region.

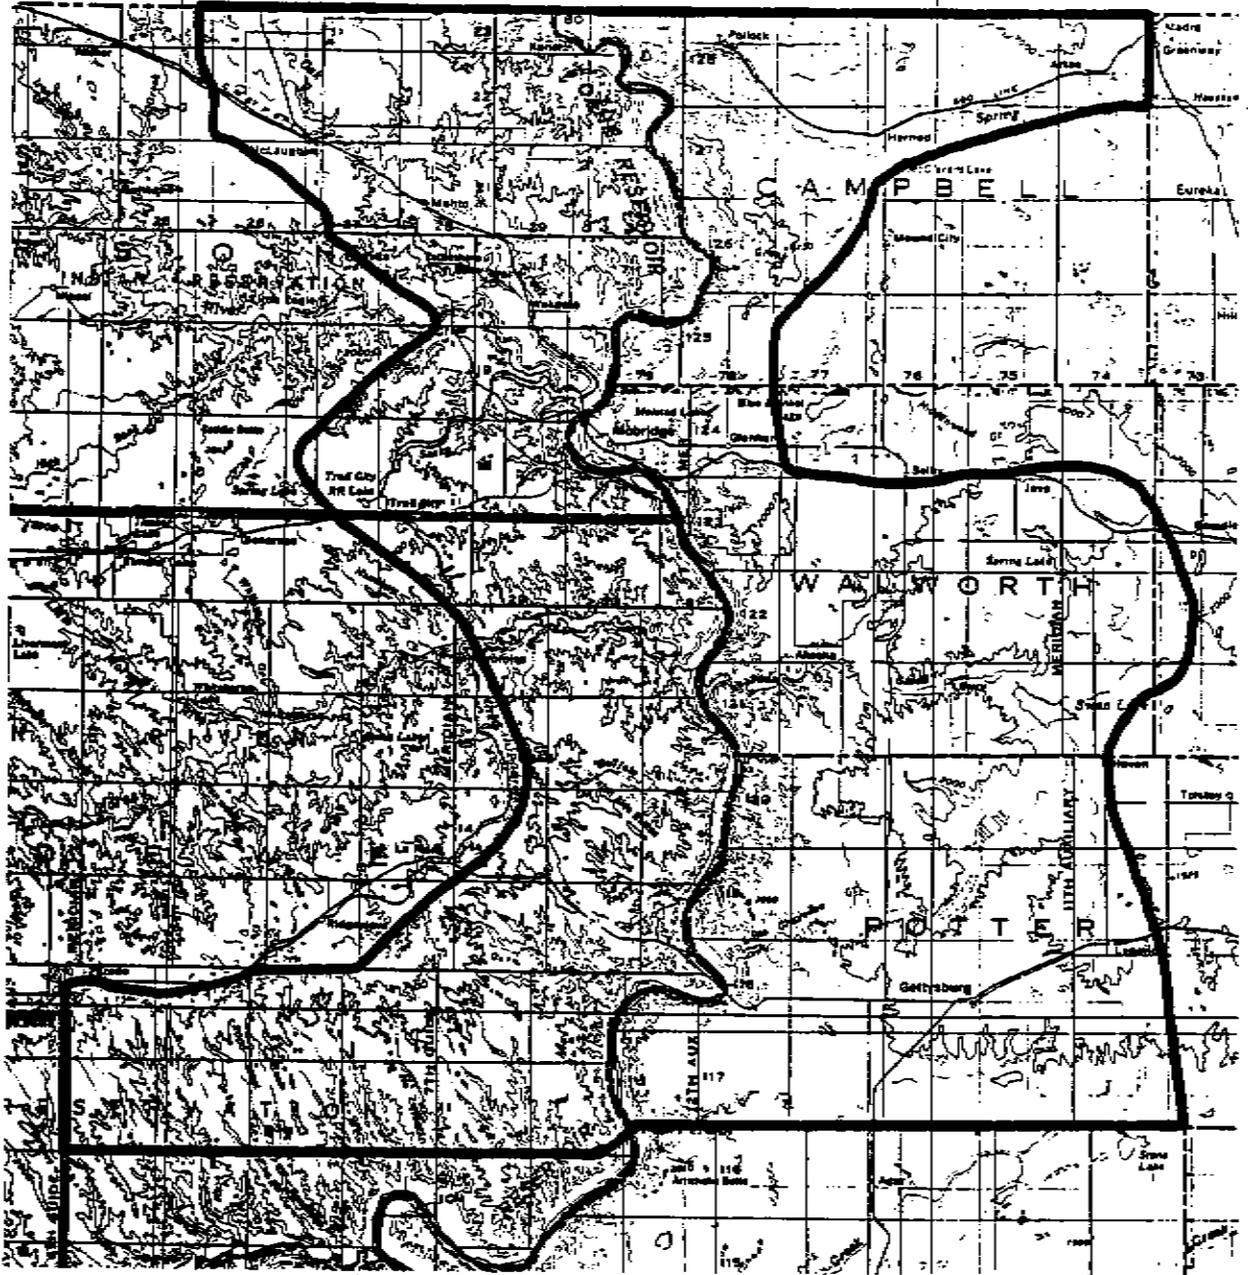

PROTOHISTORIC/CONTACT PERIOD:

RESERVATIONS. Rosebud Sioux Indian Reservation.

SANDHILLS DISCUSSION

Virtually nothing is known of the archaeological resources of this region, making basic inventory and data collection the primary research goals. The region has the potential for providing information on cultural changes associated with the early period of reservation settlement.

GRAND/MOREAU

GRAND/MOREAU

ARCHAEOLOGICAL REGION #11

SETTING

The Grand-Moreau Region consists of the Missouri River valley trench and adjacent breaks in north-central South Dakota. The eastern border of the region generally coincides with the Coteau du Missouri landform while the western edge of the region is roughly drawn at a point where the Grand and Moreau rivers remain free-flowing (not affected by the pool elevation of Oahe Reservoir). The southern border of the region is arbitrarily drawn along a line parallel with the Potter-Sully County line west to Ziebach County. Present-day topography of the area is characterized by river terraces and breaks areas adjacent to the river. East and west of the breaks are plains covered by Pleistocene and Recent wind-blown loess deposits. Portions of Corson, Campbell, Dewey, Walworth, and Potter counties are included in the Grand/Moreau Region.

NOTE: Lehmer's "Grand-Moreau" Region (1971:29) included only the Missouri River trench and extended from the old Cheyenne Indian Agency (approximately where Highway 212 crosses the Oahe Reservoir today) to within 15 miles of the North Dakota-South Dakota border. Lehmer's "Cannonball" Region included the northernmost area of the Missouri River trench in South Dakota.

SUMMARY OF PREVIOUS ARCHAEOLOGICAL INVESTIGATIONS

The earliest research in this region was conducted by W. H. Over of USDM. Over's work consisted primarily of recording sites along the Missouri River (Sigstad and Sigstad, eds. 1973). In the late 1940s, the Missouri River valley became a major focus of intensive survey and excavation projects under the auspices of the RBS. These research projects continued in the field until after the reservoirs reached full operating levels (e.g., Davis site, 1969; Walth Bay, 1970-1971; Helb, 1972-1973) and research on the data collected continues today. The RBS excavations produced extensive comparative collections, especially for Plains Village period populations. Additional excavation and survey work has been sponsored along the Missouri River by the USACE since the late 1970s. In 1977-1978, SARC conducted excavations in Corson County in conjunction with a bridge stabilization project (Haberman 1982). Recent research has been sponsored by the National Park Service in an effort to analyze collections made by

earlier RBS investigators (e.g., Knudson et al. 1983). There have also been several investigations associated with large-scale irrigation projects on Indian lands (Winham 1985; Winham and Butterbrodt 1983). Many small-scale CRM surveys (e.g., Haberman 1984a) and test excavations (e.g., Haberman 1987) have been conducted in the area. Major research along the Missouri River trench is discussed under Contexts. It should be noted that few research projects have been conducted outside the Missouri River trench area (e.g., Buechler 1985b; Lueck, Butterbrodt and Winham 1984; Roetzel and Woolworth 1978).

Much information about this region has been obtained from interviews with amateur collectors. Mr. Marion Travis, a resident of Mobridge and a longtime member of the South Dakota Archaeological Society, is particularly active. Mr. Travis is very well-versed in the cultural resources of the area, keeps accurate notes, and has brought significant archaeological sites to the attention of professional archaeologists. The profession is indebted to the efforts of Mr. Travis.

HISTORIC CONTEXTS

PALEOINDIAN:

FOLSOM. Folsom complex materials have been reported from surface collections by Marion Travis (Travis and Haberman 1983). These materials are the earliest confirmed manifestations of Paleoindian populations within the region.

PLANO. Plano complex materials have been reported from reconnaissance surveys along the Missouri River (e.g., Weston et al. 1979). Late Paleoindian materials have also been recovered in excavations at the Travis 2 site (Ahler et al. 1977) and at the Walth Bay site (Ahler et al. 1974). Diagnostic materials from these sites appear to be similar to Angostura projectile point styles recovered from the Long site in southwestern South Dakota (Wheeler n.d.b).

EARLY ARCHAIC: Materials assigned to the Early Archaic period have been excavated at the Travis 2 site (Ahler et al. 1977), at the Walth Bay site (Ahler et al. 1974), and in the Indian Creek vicinity (Winham and Lueck 1984). Weston et al. (1979) also report surface materials assigned to this temporal/cultural period.

MIDDLE ARCHAIC: Middle Archaic period materials have been reported by Ahler et al. (1974, 1977); Haberman (1982); and Weston et al. (1979).

LATE ARCHAIC: Diagnostic corner-notched projectile points are reported from the Travis 2 site (Ahler et al. 1977). Sites recorded by Weston et al. (1979) and Winham and Lueck (1983) may also be assigned to this period.

LATE PREHISTORIC:

WOODLAND:

MIDDLE WOODLAND. Excavations of burial mounds in the northern portion of the region suggest the area was utilized by Middle Woodland populations (Neuman 1975).

BESANT. Besant projectile points in this region are associated with Woodland ceramics and burial mounds.

LATE WOODLAND. A number of Late Woodland components have been recognized along the Middle Missouri River (Ahler et al. 1981; Benn 1981; Gregg et al. 1983).

PLAINS VILLAGE: A number of major excavations have been conducted at Plains Village sites within this region. Published reports summarizing these excavations are listed below by county.

Campbell County - Baerreis and Dallman 1961; Falk and Calabrese 1973; Knudson et al. 1983.

Corson County - Ahler 1977b; Haberman 1982; Stephenson 1971; Weakly 1961; Woolworth and Wood 1964.

Dewey County - Hoffman 1963a, 1963b, 1967.

Potter County - Miller 1964; Winham and Lueck 1983.

Walworth County - Ahler et al. 1977; Baerreis and Dallman 1961; Falk and Ahler 1988; Owsley et al. 1977; Wilmeth 1958; Winham and Lueck 1983.

Lehmer (1971) provides a broad synthesis of the Plains Village period resources in the Middle Missouri subarea. Other research which integrates data from sites within the Grand/Moreau Region is available in: Ahler 1975a (lithics); Jantz and Ubelaker 1981; Johnson 1980 (ceramics); Lueck, Lippincott and Winham 1989 (survey); Rose et al. 1984 (skeletal biology); Theissen 1977 (chronology); Weymouth 1980 (magnetometer survey); Winham 1984 (Moreau Village analysis); Winham and Lueck 1983 (test excavations); and Winham and Lueck 1987 (survey).

EXTENDED MIDDLE MISSOURI.

TERMINAL MIDDLE MISSOURI.

EXTENDED COALESCENT.

POST-CONTACT COALESCENT.

PREHISTORIC THEMATIC:

MOUNDS.

PROTOHISTORIC/CONTACT PERIOD: Published reports of excavated Protohistoric period sites within the region include data on PCC variant localities (Baerreis and Dallman 1961; Hurt 1957, 1959; Hurt et al. 1962; Knudson et al. 1983), as well as early trade outposts (Smith and Ludwickson 1983). Excavations at the Leavenworth site (Bass et al. 1971; Krause 1972) are also considered a contribution to the data base

of this temporal/cultural period. Wedel (1955) and Strong (1972) provide early overviews of materials from the Grand/Moreau Region.

HISTORIC NATIVE AMERICAN TRIBES.

ARIKARA:

SIOUX:

RESERVATIONS. Standing Rock and Cheyenne River Sioux Reservations are within this region.

HISTORIC EURO-AMERICAN: Few published reports document the historic period within this region.

EARLY COMMERCIAL EXPLOITATION AND MILITARY PRESENCE.

FUR TRADING POSTS:

OTHER EURO-AMERICAN.

FARM AND RANCH:

URBAN DEVELOPMENT: Le Beau and Forest City are abandoned townsites.

TRANSPORTATION STRUCTURES: Railheads such as Everts.

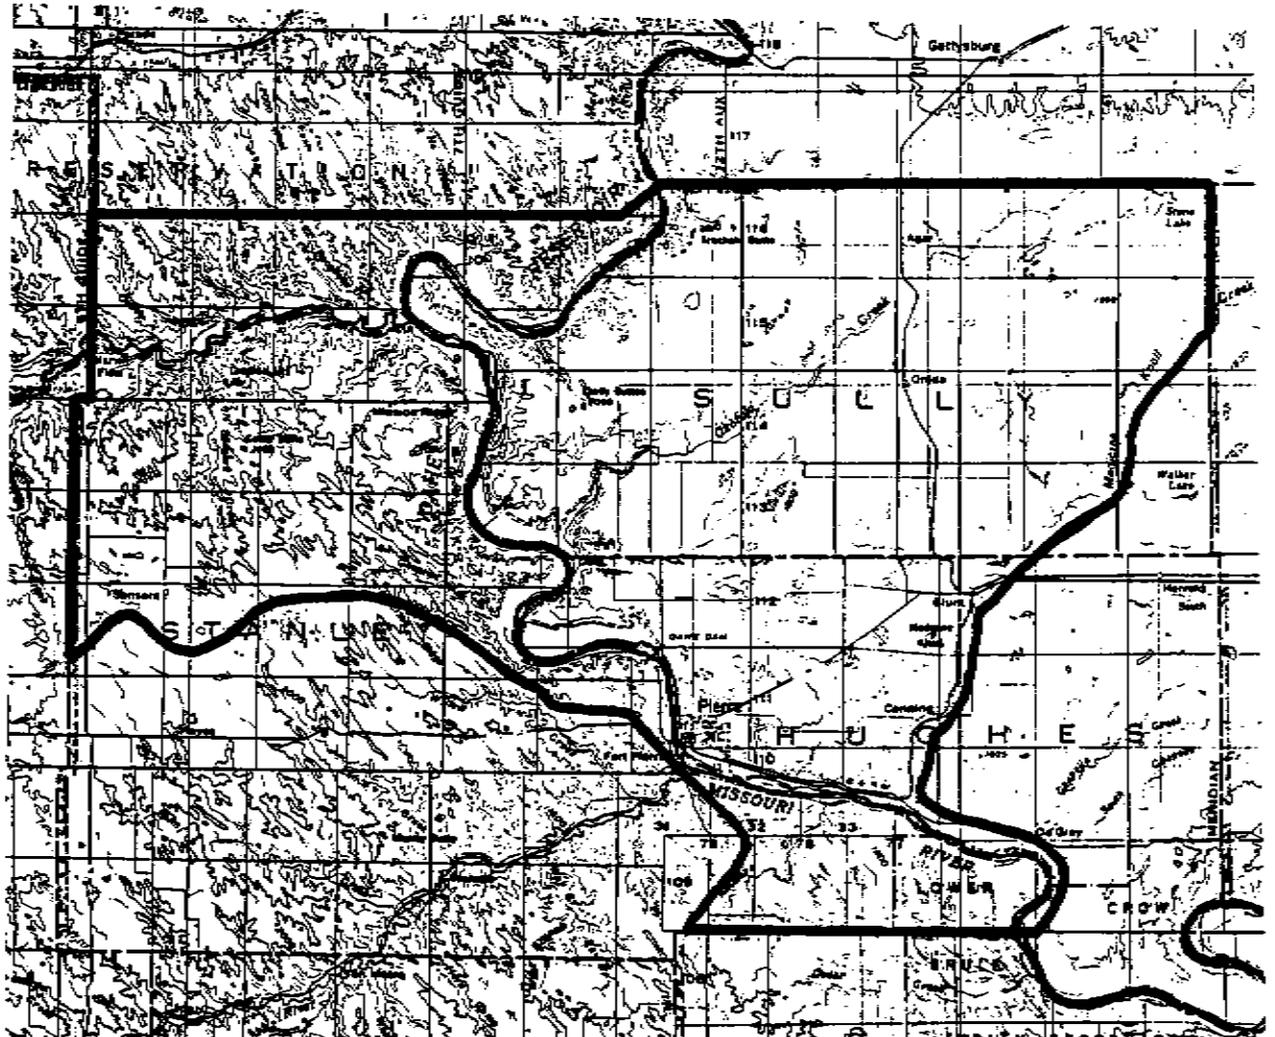

GRAND MOREAU DISCUSSION

A need exists for additional investigations immediately outside the Missouri River trench to provide basic inventory data. There is the question of whether the Grand/Moreau Region was intensively occupied by early populations or if the data base is the result of a research bias caused by the presence of an avid lay archaeologist (Marion Travis) and a focus on the trench.

The region has the potential to address many contexts (above), with a particular focus on Plains Village occupation. Historic period research into railheads, such as Everts, and abandoned townsites, such as Le Beau and Forest City, is needed.

Applicable to this region and other regions along the Missouri River trench in particular, is the need to complete reports on all sites excavated by the RBS but never analyzed.

BAD/CHEYENNE

BAD/CHEYENNE

ARCHAEOLOGICAL REGION #12

SETTING

The Bad/Cheyenne Region is located in central South Dakota. The area consists of the Missouri River valley, Missouri River breaks, and adjacent plains areas. The boundaries for this region are arbitrarily drawn to include all areas south of a line parallel to the Sully-Potter County line west to Ziebach County, east of Ziebach-Dewey and Haakon-Stanley counties outside the Bad River drainage basin, and north of the Stanley-Lyman County line. The eastern border extends from the intersection of Sully-Hyde-Hughes counties southwest to the extreme northeast corner of Lyman County. Present-day topography is characterized by the Missouri River valley, rough, steeply-rolling river breaks and adjacent grass-covered plains.

NOTE: Lehmer's (1971) Bad/Cheyenne Region included only the Missouri River trench and extended from the mouth of the Bad River to the old Cheyenne Indian Agency (approximately where Highway 212 crosses Oahe Reservoir today).

SUMMARY OF PREVIOUS ARCHAEOLOGICAL INVESTIGATIONS

An overview summarizing past archaeological research in the Bad/Cheyenne Region would be similar to that discussed for the Grand/Moreau Region, as well as for the entire Missouri River trench in South Dakota.

The first investigations were conducted by Over (Sigstad and Sigstad, eds. 1973) of USDM. From the late 1940s through the late 1960s the RBS conducted major survey and excavation projects in the region. Beginning in the mid-1970s, the USACE incorporated large-scale surveys and limited test excavations into their cultural resource management program. Small-scale contract surveys and test excavations have also been conducted in the region (e.g., Church 1985a; Sigstad and Biggs 1974; Tratebas 1976b; Winham 1983c). A result of these efforts has been the development of a large resource base focused on the Missouri River trench. Major research projects within the Bad/Cheyenne Region are discussed under contexts.

HISTORIC CONTEXTS

PALEOINDIAN: There are no recorded sites assigned to the Paleoindian period within the Bad/Cheyenne Region. There are unconfirmed reports of Paleoindian projectile points collected in the Cheyenne River and Sutton Bay vicinities.

ARCHAIC: Sigstad and Biggs (1974) report Archaic materials within this region. Pre-ceramic materials are reported by Winham and Lueck (1983) and by Hannus and Winham (1988).

WOODLAND: Component D at Over's La Roche site (Hoffman 1968) is perhaps the best-known Woodland component within this region. Excavations at the site provided the northernmost evidence of a Woodland structure in South Dakota (Hoffman 1968).

SONOTA COMPLEX. Haberman (1979) has conducted limited test excavations at a site (39ST80) in Stanley County which has been assigned to the Sonota complex.

PLAINS VILLAGE: A relatively large number of Plains Village period sites have been excavated in this region, most under the auspices of the RBS. Published reports are listed below by county.

Stanley County - Hoffman 1968; Jensen 1965, 1967; Jones 1967; Lehmer 1954; Lehmer and Jones 1968; Meleen 1948; Nowak 1979, 1983; Wood 1976.

Hughes County - Brown 1965, 1974; Hannus and Winham 1988; Hurt 1953; Johnston 1967a; Meleen 1949; Spaulding 1956; Wheeler 1955.

Armstrong County (now Dewey County) - Hurt 1970.

Major survey reports which discuss sites of this period (and other periods) include Falk et al. 1984; Toom and Artz 1985; Toom and Picha 1984; Winham and Lueck 1987; and Winham et al. 1984, 1987, 1988.

INITIAL MIDDLE MISSOURI.

EXTENDED MIDDLE MISSOURI.

INITIAL COALESCENT.

EXTENDED COALESCENT.

POST-CONTACT COALESCENT. A number of PCC variant sites dating from A.D. 1675 to 1795 have been investigated within the Bad/Cheyenne Region. Published reports for these research projects include: Brown 1965; Lehmer 1954; Lehmer and Jones 1968; and Johnston 1982.

PREHISTORIC THEMATIC:

PETROFORMS. Boulder outlines need to be further examined (Abbott et al. 1982).

PROTOHISTORIC/CONTACT PERIOD:

HISTORIC NATIVE AMERICAN TRIBES.

ARIKARA:

SIOUX:

RESERVATIONS. Cheyenne River Sioux Reservation is partly included in this region.

HISTORIC EURO-AMERICAN: Little research within this region has focused on the historic resources. Sigstad and Biggs (1974) report a number of Euro-American sites in eastern Sully County.

EARLY COMMERCIAL EXPLOITATION AND MILITARY PRESENCE.

FUR TRADING POSTS: Excavations have been conducted at early American fur trading posts in the area (Smith 1960, 1968).

FORTS:

OTHER EURO-AMERICAN.

FARM AND RANCH: Early ranching present.

TRANSPORTATION STRUCTURES: Early transportation routes present.

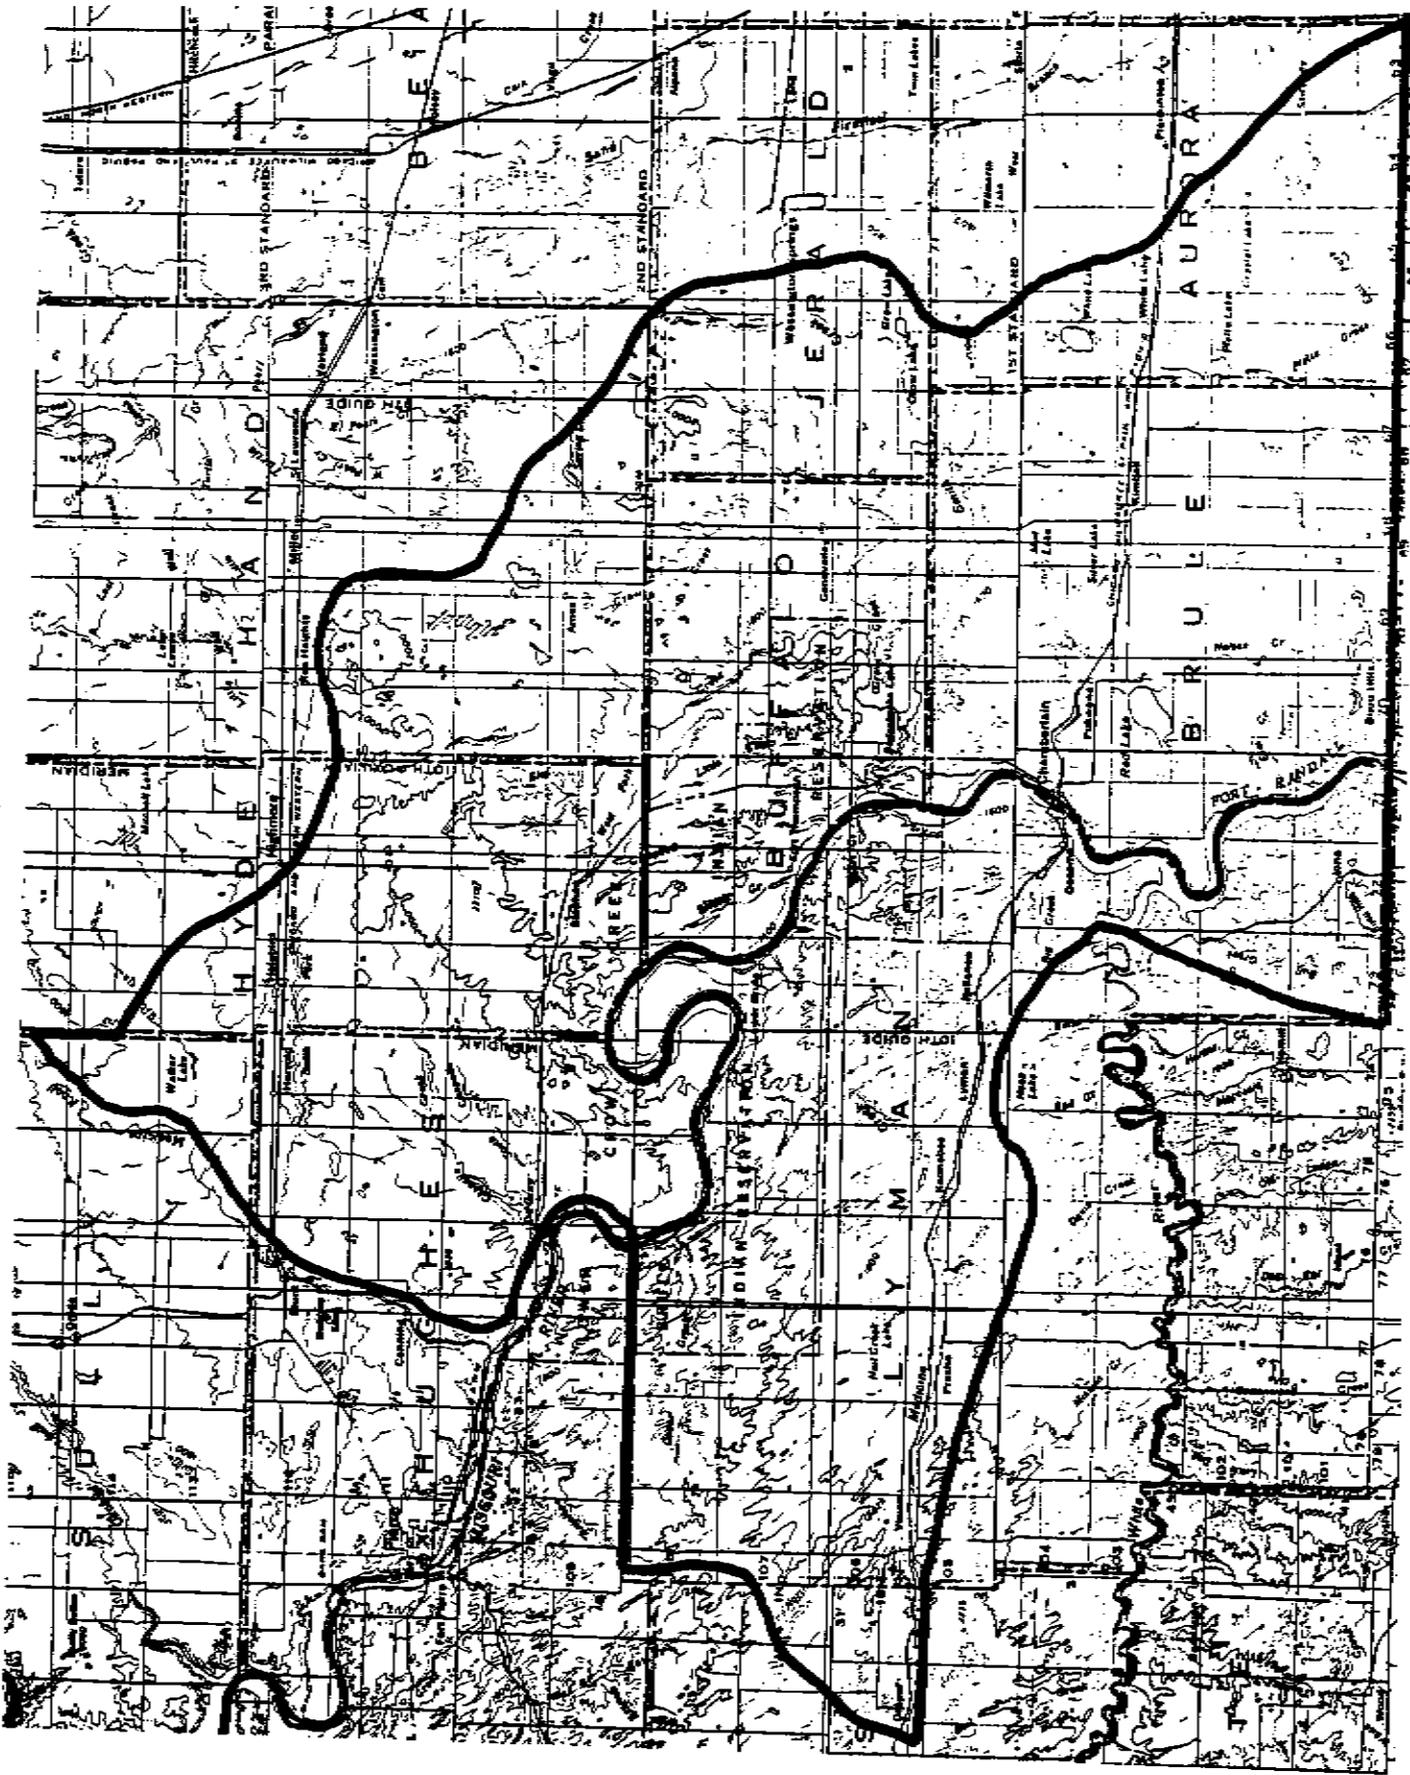

RIVER: Steamboat travel present.

BAD-CHEYENNE DISCUSSION

The primary focus of archaeological activity in this region has been the Missouri River trench and there is a need for more study in off-trench areas. Pre-Plains Village archaeology is poorly-documented, with most emphasis being placed on Plains Village research.

Protohistoric and historic research could focus on early fur trade outposts, early frontier military outposts, steamboat travel, early transportation routes and early ranching activities.

BIG BEND

BIG BEND

ARCHAEOLOGICAL REGION #13

SETTING

The Big Bend Region is located in central South Dakota. The area encompasses the Missouri River valley, breaks and adjacent plains. Also included in the Big Bend Region are the Missouri Hills, or that portion of the Coteau du Missouri south of Ree Hills. That portion of the White River which is influenced by pool elevations of the Ft. Randall Reservoir is also included in the region. Portions of Hyde, Hand, Hughes, Jones, Lyman, Jerauld, and Aurora counties, as well as all of Buffalo and Brule counties, are within this region. Present-day topography consists of Missouri River terraces, steeply rolling breaks, and rolling grass-covered hills and plains.

NOTE: Lehmer's (1971) Big Bend Region included **only** the Missouri River trench and extended from below the mouth of the White River to just above the mouth of the Bad River.

SUMMARY OF PREVIOUS ARCHAEOLOGICAL INVESTIGATIONS

The overview of previous archaeological research in the Big Bend Region is essentially the same as previously discussed for portions of the Missouri River trench. It should be noted that nearly all of the federal land administered by the USACE has been surveyed. Hurt (1961) published a brief description of excavations conducted near Ree Heights (39HD3). Major excavation and survey projects are discussed under Contexts.

HISTORIC CONTEXTS

PALEOINDIAN: No sites can be positively assigned to these contexts in this region. Toom and Picha (1984) report that early sites have been observed eroding out of terrace edges near tributary streams in the Big Bend area, but they are relatively rare and little research has been conducted at these sites.

EARLY ARCHAIC: Analysis of the Medicine Crow site complex (39BF2) (Ahler and Toom 1989) indicates this site was first occupied at about 8000 years B.P. by peoples associated with what has come to be known as the Logan Creek complex (Kivett 1962a, 1962b). Distinctive tool types include side-notched Simonsen projectile points and thin, unnotched triangular DeLong points. This site was repeatedly occupied during the Early Archaic.

MIDDLE ARCHAIC:

MCKEAN/DUNCAN/HANNA. McKean phase diagnostic projectile point types are reported from components situated below burial mounds at a number of sites in this area (Neuman 1964a). Irving (1958) also discusses early remains found at the Medicine Crow site in Buffalo County. Ahler and Toom (1989) indicate that the Middle Archaic occupation at Medicine Crow (39BF2), between 5000 and 7000 B.P., was less frequent and less intense than the Early Archaic utilization. There is some indication that the Middle Archaic peoples were the direct descendants of the Logan Creek complex peoples. McKean phase materials were observed in private collections from Ree Heights (39HD3).

LATE ARCHAIC:

Ahler and Toom (1989) assign the last major preceramic human occupation at Medicine Crow, 3000-5000 B.P., to the Late Archaic. Stemmed Duncan projectile points, which to the west and north are part of the McKean complex, are the most distinctive artifact type of this period at Medicine Crow.

LATE PREHISTORIC:

AVONLEA. Question of Avonlea presence within the Missouri River trench (Johnson 1984).

WOODLAND: The Big Bend Region is a major focus for burial mounds generally associated with Woodland populations. The mounds are a prominent archaeological feature, situated on the first high terrace overlooking the Missouri River valley. They occur with frequency from the lower end of Big Bend Reservoir to the mouth of Crow Creek, but they also occur elsewhere. Woodland sites are reported in the region by a number of investigators (e.g., Gant 1967; Neuman 1960, 1961a, 1961b, 1964a, 1964b; Olson and Zimmerman 1979; Smith 1977; Toom and Picha 1984; Winham and Lueck 1984).

GREAT OASIS: Ree Heights?

PLAINS VILLAGE: Plains Village tradition sites are discussed in numerous excavation and survey reports pertaining to the Big Bend Region (e.g., Butterbrodt 1982; Caldwell 1960a, 1963, 1966; Caldwell and Jensen 1969; Caldwell et al. 1964; Falk et al. 1984; Fitting 1978; Gant 1962b, 1967; Hurt 1951; Husted 1965; Jensen 1966; Johnson 1977, 1979; Karklins 1970; Kay 1973; Kivett and Jensen 1976; Neuman 1964b; Olson and Zimmerman 1979; Smith 1975, 1977; Smith and Grange 1958; Smith and Johnson 1968; Toom and Picha 1984; Wardlow and Lees 1989; Winham 1982, 1983b, 1987; Winham and Lueck 1984; Winham and Winham 1983; Winham et al. 1987; Zimmerman 1981).

INITIAL MIDDLE MISSOURI. Ree Heights?

EXTENDED MIDDLE MISSOURI.

INITIAL COALESCENT.

EXTENDED COALESCENT.

POST-CONTACT COALESCENT. PCC components are reported at a number of sites in the Big Bend Region (e.g., Irving 1958; Smith 1977; Smith and Johnson 1968). The last major human habitation of the Medicine Crow site complex was by PCC representatives of the Plains Village tradition who used the site for a series of permanent and semipermanent villages in the A.D. mid-1700s. Significant processes of change among the Arikara resulting from indirect, and possibly limited direct, contact with Western (Euro-American) culture were undoubtedly in motion by this time (Ahler and Toom 1989).

PREHISTORIC THEMATIC:

BISON JUMPS. Ree Heights buffalo jump (39HD3) is a multicomponent site containing materials which appear to be related to the McKean phase, Great Oasis/IMM, and possibly other later components. Hurt (1961) examined the site area but could not prevent the landowners and other interested local residents from excavating the site as part of a community effort. The landowners have maintained a comparative collection of cultural materials from the site. The site may have consisted of drive lanes, a jump, impound corral, and a processing station.

STONE CIRCLES. Nowak 1984c.

MOUNDS.

LITHIC PROCUREMENT. Bijou Hills quartzite outcrops and the Burning Brule shale beds.

PROTOHISTORIC/CONTACT PERIOD:

HISTORIC NATIVE AMERICAN TRIBES.

ARIKARA: Medicine Crow (39BF2).

SIOUX: Crow Creek Indian Reservation is located in this region.

HISTORIC EURO-AMERICAN: Historic sites have rarely been excavated within this region; however, nearly every large-scale survey has recorded historic sites. A relatively high density of historic sites was recorded in the southern portion of the region and adjacent areas south of the region by Lees et al. (1985).

EARLY COMMERCIAL EXPLOITATION AND MILITARY PRESENCE.

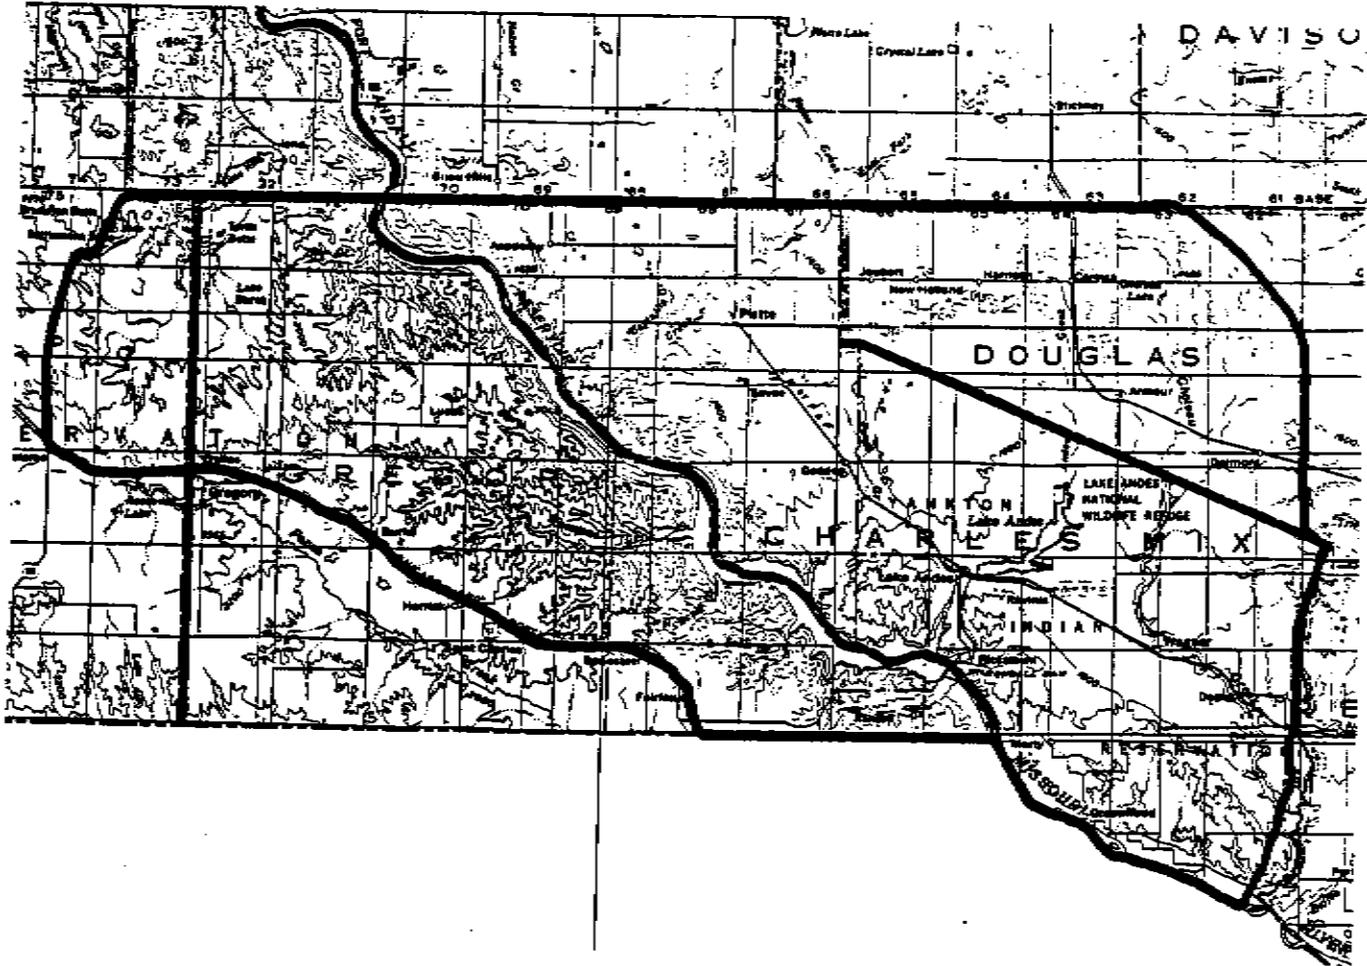

FUR TRADING POSTS: A number of early trading outposts are discussed by Smith (1968).

BIG BEND DISCUSSION

The Missouri River trench has provided the focus for most archaeological investigations in this region. This research needs to incorporate geomorphological studies to enhance our understanding of buried site locations and contexts. This may be particularly significant for Woodland period sites. The southern portion of the Big Bend Region has several sites containing Great Oasis phase components which need to be further defined.

Early Indian/white relationships may be examined from an archaeological perspective at some of the early trading outposts and agencies (i.e., Fort Kiowa, American Crow Agency, Red Cloud Agency). The region offers the potential to study cultural adaptation and change to early reservation life (Lees 1985).

FT. RANDALL

FT. RANDALL

ARCHAEOLOGICAL REGION #14

SETTING

The Ft. Randall Region encompasses the Missouri River valley, breaks and adjacent plains in south-central South Dakota. The general topography of the area consists of Missouri River terraces, steeply-rolling breaks, and adjacent plains. The region includes portions of Gregory, Douglas, and Hutchinson counties, as well as all of Charles Mix County. It contains one of the few areas of the Missouri River valley unaffected by impoundments in South Dakota.

NOTE: Lehmer (1971) did not name this region of the Missouri River trench. The southernmost region in Lehmer's Middle Missouri Subarea is his Big Bend Region. Lehmer notes "There is some question as to where the southernmost part of South Dakota, including the Missouri Valley below the White River, should be assigned" (Lehmer 1971:28).

SUMMARY OF PREVIOUS ARCHAEOLOGICAL INVESTIGATIONS

The overview of previous archaeological investigations along the Missouri River trench in the Ft. Randall Region is essentially the same as for other Missouri River regions. However, it should be noted that although the RBS recorded numerous sites in the area, relatively few sites were excavated. Caldwell is quite explicit about the implications of this research bias in the preface to the Hitchell site report (Johnston 1967b). Caldwell states:

We have come to realize that the loss of archeological data within the Fort Randall Reservoir was particularly tragic because the area seems to have been crucial in the development and growth of both the Middle Missouri and Coalescent Traditions, cultural streams that dominated much of the Dakotas for a millennium or more.

Some test excavations have been undertaken in recent years (Winham 1987).

Additional research outside the Missouri River trench has been conducted in the Ft. Randall Region. This research includes a statistical sample survey of the proposed Lake Andes-Wagner Irrigation project (Buechler 1983), as well as a Class III evaluation of sites in that project area (Church et al. 1984). Projects associated

with Fort Randall and the Fort Randall Post Cemetery (Hannus, Lueck and Winham 1986b) and with the proposed Gregory County Pumped Water Storage Facility (Bambrey, 1985; Lippincott 1989; Lueck 1981) have also been accomplished.

HISTORIC CONTEXTS

PALEOINDIAN/EARLY ARCHAIC/MIDDLE ARCHAIC: No diagnostic Paleoindian or Early Archaic period materials have been positively identified within the region. Hanenberger (1980) recorded a DeLong type projectile point as a possible Paleoindian component; however, the DeLong point type is poorly-documented and may represent an early manifestation of Archaic materials. Hanenberger does report observing projectile points similar to those described by Neuman (1964a) in private collections from the region.

WOODLAND: Woodland materials have been excavated in the Ft. Randall Region by Hurt (1952) and Johnston (1967b). A number of survey projects have also reported Woodland materials: Buechler 1983; Church et al. 1984; Cooper 1947b, 1949; Hanenberger 1980; Kay 1973; Lees 1985; Olson and Zimmerman 1979.

GREAT OASIS: A relatively large number of Great Oasis phase sites have been identified in the Ft. Randall Region (Hanenberger 1980; Johnston 1967b). Great Oasis populations appear to provide a transitional phase between Late Woodland populations and IMM variant populations. Indeed, many of the Great Oasis components in the Ft. Randall Region are associated with Woodland materials.

PLAINS VILLAGE: Plains Village materials have been reported in the region (e.g., Buechler 1983; Church et al. 1984; Lees et al. 1985; Olson and Zimmerman 1979).

INITIAL MIDDLE MISSOURI.

EXTENDED COALESCENT. Excavations conducted by Hurt (1952) identified an EC variant component at the Scalp Creek site in Gregory County. A late expression of the EC variant, named the Redbird focus (Wood 1965), has been defined just south of the Ft. Randall Region, in Nebraska.

PREHISTORIC THEMATIC:

SACRED SITES. Sioux.

LITHIC PROCUREMENT. Bijou Hills and Iona Hills outcrops.

PROTOHISTORIC/CONTACT PERIOD: Mattes (1949) provides an extensive discussion of the historical resources of a portion of this region. Additional summaries are provided by Church et al. (1984) and by Lees et al. (1985). In summary, the historical resources of the

region include military posts, early trading outposts, adaptation to reservation life, early Indian Agencies, and abandoned townsites.

HISTORIC NATIVE AMERICAN TRIBES.

RESERVATIONS.

SIoux: This region includes the Yankton Sioux Indian Reservation and a portion of the Rosebud Sioux Indian Reservation. Howard (1976) provides an interesting discussion of the ethnogeography of the Yankton Sioux that is relevant to the Ft. Randall Region.

OTHER PROTOHISTORIC/CONTACT PERIOD.

INDIAN AGENCIES:

CHRISTIAN MISSIONS: Examine interaction of Sioux and Christian missionaries - Marty Mission.

HISTORIC EURO-AMERICAN:

EARLY COMMERCIAL EXPLOITATION AND MILITARY PRESENCE.

FUR TRADING POSTS:

FORTS: Excavations at Fort Randall took place from 1986-1989 as part of a public involvement archaeology program run by the USACE. The Post Cemetery was investigated as well (Hannus, Lueck and Winham 1986b).

OTHER EURO-AMERICAN.

FARM AND RANCH: Mulehead Ranch (address early ranching activities).

URBAN DEVELOPMENT: Abandoned townsites.

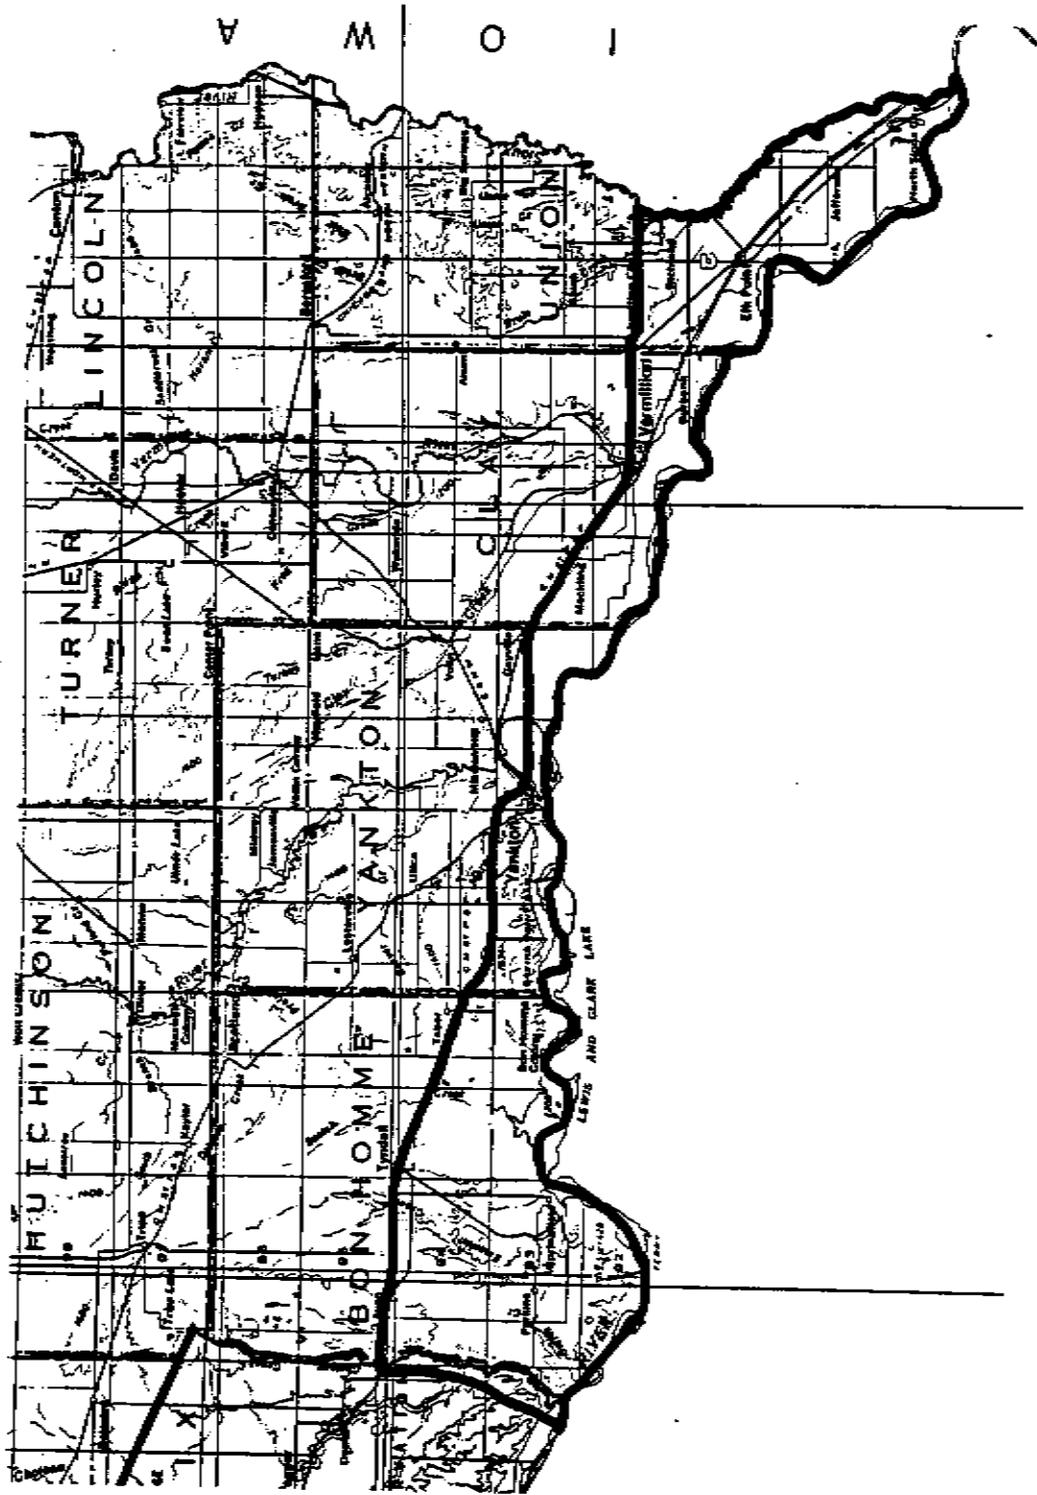

TRANSPORTATION STRUCTURES: Early transportation routes.

RIVER DEVELOPMENT: Steamboat activities.

FORT RANDALL DISCUSSION

The Missouri River has provided a focus for archaeological study in this region, but not to the extent of regions further north. The identification and definition of preceramic cultural components is needed as is further documentation of protohistoric and historic resources. Some of these resources include: Ft. Randall; the Trudeau post; the Papineau post; and the Whetstone and Greenwood agencies.

YANKTON

YANKTON

ARCHAEOLOGICAL REGION #15

SETTING

The Yankton Region is defined as that area south of SD Highway 50 from the Charles Mix-Bon Homme County line east to the South Dakota-Iowa border. This area encompasses the Missouri River valley, the floodplain (below Gavin's Point Dam), breaks, and adjacent plains (especially in Bon Homme County). The general topography consists of broad, flat floodplain zones, steeply-rolling breaks and bluffs, and rolling plains. The area is drained by the Missouri River; the confluence of three major drainage basins, the James, Vermillion, and Big Sioux, is located in this region. Gavin's Point Dam and Lake Lewis and Clark are also located in this region.

SUMMARY OF PREVIOUS ARCHAEOLOGICAL INVESTIGATIONS

The overview of previous archaeological research in the Yankton Region is similar to that provided for other regions along the Missouri River in South Dakota. Early investigations were conducted by Over (Sigstad and Sigstad, eds. 1973) of USDM. Personnel associated with the RBS conducted surveys and limited test excavations in the area (e.g., Hall 1961). The USACE has funded surveys, test excavations and literature searches (Blakeslee and O'Shea 1983; Caldwell 1960b; Ludwickson et al. 1981; Zimmerman and Bradley 1978), while the National Park Service sponsored a survey of the west bank of the Big Sioux River (Sigstad 1973b) and Lewis and Clark Lake (Howard and Gant 1966). The South Dakota Historical Preservation Center has supported two survey and inventory projects (Buechler and Keller 1983; Hanenberger 1980). In addition to these activities, a number of small-scale contract projects have been conducted in the region.

HISTORIC CONTEXTS

PALEOINDIAN: One possible Paleoindian component has been identified within the Yankton Region (Blakeslee and O'Shea 1983). Zimmerman and Alex (1977) report Pleistocene age Bison occidentalis remains washing out of the tailwaters of Gavin's Point Dam.

EARLY ARCHAIC/MIDDLE ARCHAIC: No sites within this region have been positively assigned to either the Early or Middle Archaic periods. Blakeslee and O'Shea (1983) report that site 39BO51 may be

Archaic in age. The results of Howard and Gant's (1966) research suggests that early sites in the area are likely to be deeply-buried.

WOODLAND: Woodland sites are commonly reported in the Yankton Region (Blakeslee and O'Shea 1983; Brown 1968; Hall 1961; Hanenberger 1980; Hurt 1961; Sigstad and Sigstad, eds. 1973; Zimmerman and Bradley 1978). Published reports of excavations conducted at Woodland sites in the area include: Hurt (1961) and Zimmerman and Bradley (1978). As noted by Howard and Gant (1966), Woodland sites are likely to be deeply-buried.

GREAT OASIS: Great Oasis materials are reported in the area but most may be IMM (Blakeslee and O'Shea 1983; Brown 1968; Hall 1961; Hanenberger 1980; Zimmerman and Bradley 1978).

PLAINS VILLAGE: Few Plains Village period sites have been reported in the region (e.g., Blakeslee and O'Shea 1983; Hanenberger 1980).

INITIAL MIDDLE MISSOURI.

MILL CREEK VARIANT: Mill Creek components are reported by Blakeslee and O'Shea (1983).

BASAL COALESCENT.

ST. HELENA PHASE: Blakeslee and O'Shea (1983) and Ludwickson et al. (1981) report St. Helena phase materials in the Gavin's Point area of this region.

ONEOTA: Oneota sites have been reported in the region by Mott (1938) and Blakeslee and O'Shea (1983). Vermillion Bluffs Oneota site.

PROTOHISTORIC/CONTACT PERIOD: Protohistoric resources other than those specified below include Dickson's Post/Ft. Vermillion (may be related to Santee/Yankton village) discussed by Woolworth (1974); the ferry crossing the James River; and early steamboat activities.

HISTORIC NATIVE AMERICAN TRIBES.

IOWAY: Wedel 1976.

SIOUX: Yankton or Dakota Sioux. Howard and Gant (1966) and Ludwickson et al. (1981) discuss protohistoric and historic utilization of the area by Yankton Sioux. Specific resources include Smutty Bear's Yankton Village, and the Santee/Yankton Village.

RESERVATIONS.

HISTORIC EURO-AMERICAN: Few historic resources have been documented in the region (e.g., Blakeslee and O'Shea 1983; Hanenberger 1980; Ludwickson et al. 1981), although the area has considerable research potential. Lawrence Welk and his band used to play at the Hotsy-Totsy Club in Yankton!

EARLY COMMERCIAL EXPLOITATION AND MILITARY PRESENCE.

FORTS:

OTHER EURO-AMERICAN.

URBAN DEVELOPMENT: Town of Yankton.

GOVERNMENT STRUCTURES:

RIVER TRANSPORTATION: e.g., Steamboat Western

(Putz 1984).

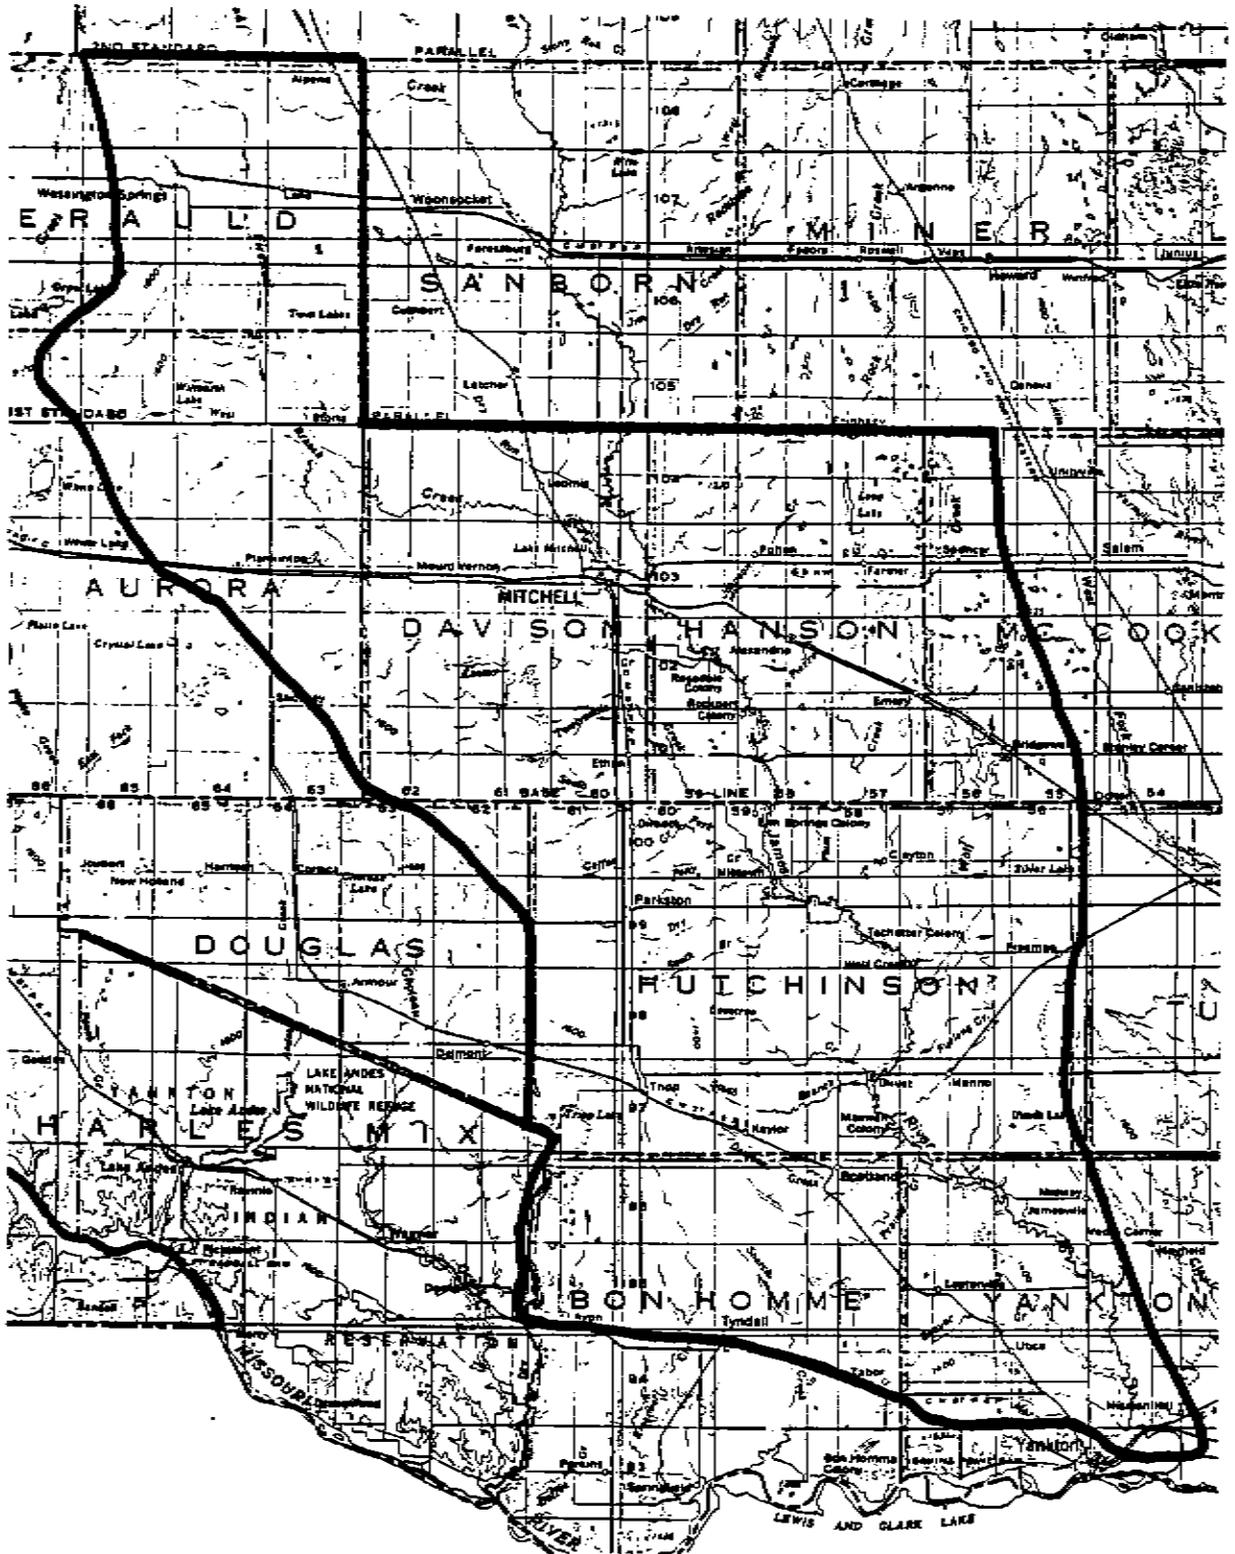

YANKTON DISCUSSION

Research into the archaeology of this region would benefit from an examination of deeply-buried cultural components using geomorphological studies. Particular emphasis is placed on studies of Woodland and Great Oasis sites in this region and the need to examine the evidence for St. Helena phase and Mill Creek occupations.

There is a need to assess whether the Vermillion Bluffs Village is loway (Orr focus) or some other variant of Oneota and whether the occupation is protohistoric or historic.

Protohistoric and historic studies need emphasis, particularly with regard to territorial government and early transportation routes.

LOWER JAMES

LOWER JAMES

ARCHAEOLOGICAL REGION #16

SETTING

The Lower James Region encompasses the lower reaches of the James River Basin in South Dakota. This region includes all or portions of Yankton, Hutchinson, Aurora, Davison, Hanson, McCook, and Jerauld counties. The James Basin is a broad, shallow trough, 50-60 miles in width (Flint 1955). The surface of the basin is relatively flat with some gently rolling hills. The nearly level floor of the basin contrasts sharply with the rugged glacial features of the Coteau du Missouri to the west, and the Coteau des Prairies to the east. In the center of the basin is the valley of the James River. The valley is a steep-sided, flat-bottomed trench, 30-100 feet in depth, and 1/2 to 1 mile in width. The modern James River meanders about a twisted, convoluted path through the valley.

SUMMARY OF PREVIOUS ARCHAEOLOGICAL INVESTIGATIONS

The earliest investigations in the area were conducted by W. H. Over of USDM. Over recorded a number of earthlodge village sites and mound groups along the James River. F. C. Kratz, an amateur archaeologist and contemporary of Over, also made extensive collections in Hutchinson and Hanson counties. Kratz, a highway engineer, kept meticulous notes and drawings of his observations which are now curated at the SARC (Sigstad 1974). Professional excavations of the Twelvemile Creek and Mitchell sites were conducted in the late 1930s by USDM (Meleen 1938, n.d.). Test excavations were also conducted in 1938 at the Bloom site (Kratz n.d.). In 1962, the RBS and the W. H. Over Museum (formerly the USDM) cooperated in salvage excavations at the Wolf Creek (Highway 44) mounds in Hutchinson County. In 1970, John S. Sigstad supervised the excavation of the Hofer mound (Kant 1979). In 1971, Robert Alex, then of the University of Wisconsin, excavated two lodges at the Mitchell site and a small test trench at the Twelvemile Creek site (Alex 1981b). As part of a bicentennial reconstruction project in 1975, John S. Sigstad reexcavated one of the lodges previously examined by Alex. In 1977-1978, survey crews funded by SHPC conducted reconnaissance level examinations of the James River valley, adjacent bluffs, and lower reaches of tributary streams in Yankton, Hutchinson, Hanson and Davison counties (Buechler and Keller 1983). Limited test excavations

were conducted at some of the recorded sites in 1978 (Buechler and Keller 1983). Beyond the James River valley, little research has been conducted in the region, although the 1980s have seen several small-scale surveys (Buechler 1985a).

In 1978, the Mitchell Prehistoric Indian Village Preservation Society appointed Darrell Fulmer as site archaeologist to direct the development of the Mitchell site as an ongoing scientific research and interpretive center. Field school students and Earthwatch volunteers have investigated the nature of the fortification ditches, defined additional structures in shallow depressions between the fortification ditches, and salvaged information along the terrace edge enabling bank stabilization to prevent further destruction of the site. A spacious interpretive center and laboratory have also been constructed. Since 1986, the ALAC has continued work at the site and has summarized the previous activities undertaken at the Mitchell site (Hannus et al. 1987). Subsequent grants have enabled expansion of the museum facility, the development of an interpretive trail and guidebook for the site, and continued limited excavation.

HISTORIC CONTEXTS

PALEOINDIAN: Paleoindian materials have been observed in private collections within the region; however, no materials have been confirmed in a cultural context.

CLOVIS/FOLSOM. Reported materials include fluted projectile points (Alex 1981b).

PLANO. Reported materials include Angostura-like points and Scottsbluff type points (Buechler and Keller 1983).

MIDDLE ARCHAIC:

OXBOW. One site has tentatively been assigned to the Archaic period based on the presence of an Oxbow-like projectile point fragment (Buechler and Keller 1983).

WOODLAND: Burial mounds, presumed to be Woodland-age, are a common archaeological manifestation along the James River valley (Buechler and Keller 1983). Woodland period materials have been identified during excavations at the Freeman (Highway 44) mounds (Gant n.d.) and the Hofer mound (Kant 1979). A number of mound groups located in the James River Basin have been included in a thematic nomination to the National Register of Historic Places. Woodland habitation sites are less common than mound sites but have been reported by Gant (n.d.) and Buechler and Keller (1983).

GREAT OASIS: A large Great Oasis village site has been reported near Mitchell by Darrell Fulmer.

PLAINS VILLAGE: There are unconfirmed reports of an earthlodge village near Mt. Vernon.

INITIAL MIDDLE MISSOURI. Early research at the Mitchell, Twelvemile Creek, and Bloom village sites, conducted by USDM, contributed to the formulation of the IMM variant (Meleen 1938, n.d.; and Over in Sigstad and Sigstad, eds. 1973). In addition to these three village sites, one additional village, the Goehring site (39HS23), was recorded in 1978 by a crew surveying along the James River. The Goehring site appears to be the largest earthlodge village on the lower James River, with over 60 lodge depressions reported (Buechler and Keller 1983). Alex (1981b) assigned all four village sites to the Lower James phase of the Initial variant of the Middle Missouri tradition. Additional IMM variant materials are reported on the eastern edge of the Coteau du Missouri near Wessington Springs (Alex 1981a, 1981b).

EXTENDED COALESCENT. EC variant materials are reported on the eastern edge of the Coteau du Missouri near Wessington Springs (Alex 1981a, 1981b).

ONEOTA: The late Plains Village period is represented at 13 sites which produced ceramics that have been assigned to the Olivet phase of the Oneota tradition (Alex 1981a, 1981b). These sites are the westernmost extension of the Oneota tradition. Alex (1981b) suggests they may be related to the Oneota occupation of the Blood Run site, located in northwestern Iowa; however, little information in a cultural context is available from these sites. The sites are all disturbed by cultivation.

PREHISTORIC THEMATIC:

BURIAL MOUNDS. Burial mounds, presumed to be Woodland-age, are a common archaeological manifestation along the James River valley (Buechler and Keller 1983). A number of mound groups located in the James River Basin have been included in a thematic nomination to the National Register of Historic Places.

PROTOHISTORIC/CONTACT PERIOD: Little is known about the protohistoric or historic resources of the Lower James Region.

HISTORIC NATIVE AMERICAN TRIBES.

YANKTON SIOUX:

HISTORIC EURO-AMERICAN:

EARLY COMMERCIAL EXPLOITATION AND MILITARY PRESENCE.

FORTS: One military fort has been recorded in Hanson County. This outpost, known as Fort James, briefly served to protect settlers in southeastern Dakota Territory from Indian raids. The fort was constructed in 1865 and abandoned in 1866.

OTHER EURO-AMERICAN.

ETHNIC ENCLAVES: Hutterites.

FARM AND RANCH:

URBAN DEVELOPMENT: Abandoned townsite of

Firesteel.

routes.

TRANSPORTATION STRUCTURES: Early transportation

LOWER JAMES DISCUSSION

The focus of archaeological activity has been on the James River and its major tributaries and there is a need for basic inventory and site location in other parts of the region. Paleoindian and Archaic materials need to be documented and Woodland habitation sites associated with burial mounds identified. The region has good potential to address Late Woodland, Great Oasis and IMM research questions.

Protohistoric and historic resources of the region need basic definition. The region has the potential to address ethnohistoric identification of the Yankton Sioux tribe, occupation of Fort James, establishment of Firesteel, early farming and ranching activities, transportation routes, and early archaeology of Hutterite colonies.

MIDDLE JAMES

ARCHAEOLOGICAL REGION #17

SETTING

The Middle James Region encompasses all of Beadle and Sanborn counties as well as portions of Hyde, Hand, Kingsbury, and Miner counties. Topographically, the area consists of the James River, adjacent bluffs, and gently rolling plains. Sand dunes form an unusual environmental zone in northern Sanborn and southern Beadle County. The western and eastern borders of the region conform to the margins of the Coteau du Missouri and Coteau des Prairies, respectively.

SUMMARY OF PREVIOUS ARCHAEOLOGICAL INVESTIGATIONS

The earliest archaeological investigations in the Middle James Region were conducted by W. H. Over of USDM. Over (Sigstad and Sigstad, eds. 1973) recorded sites along the James River valley, and the western margin of the Coteau du Missouri in Hand County. Following Over's visits to the area in the early 1930s, little research was undertaken beyond small-scale surveys. In 1979-1980, SARC examined the James River valley adjacent bluffs and lower reaches of tributary streams (Buechler and Keller 1983; Haberman 1983c). In 1982, SARC conducted a sample survey for the proposed CENDAK irrigation project in portions of the Middle James Region (Haug et al. 1983). The 1980s have also seen some small-scale CRM surveys (Buechler 1985a, 1988f).

HISTORIC CONTEXTS

PALEOINDIAN: Little is known about the early occupation of the region. There are unconfirmed reports of Paleoindian material in the Hand-Hyde County area.

MIDDLE ARCHAIC:

MCKEAN/DUNCAN/HANNA. There are unconfirmed reports of McKean phase, Middle Plains Archaic sites in the Hand-Hyde County area.

WOODLAND: A number of mound groups, presumably Woodland-age, have been recorded along the James River valley (Buechler and Keller 1983; Haberman 1983c). A number of buried Woodland cultural components have also been reported within the region (Buechler and Keller 1983; Haberman 1983c; Haug et al. 1983). Woodland projectile points have been recovered from surface collections but few habitation sites are in a cultural context (Buechler and Keller 1983; Haberman

1983c). Ceramic materials collected from the Rose Hill site in Hand County bear a strong resemblance to Great Oasis materials. Archaic or Woodland materials have been reported by Haberman (1983c).

GREAT OASIS: Ceramics from sites located along the eastern margin of the Coteau du Missouri in Hand County bear a resemblance to Great Oasis as well as IMM variant assemblages.

PLAINS VILLAGE: Plains Village period ceramic materials have been reported by Buechler and Keller (1983); Haug (1979b); Haug et al. (1983); and Over (Sigstad and Sigstad, eds. 1973). The nature of many of these sites remains enigmatic. Both the Rose Hill village site and the Miller (Lake Louise) village site have been destroyed by reservoir construction.

INITIAL MIDDLE MISSOURI. The ceramics from sites located along the eastern margin of the Coteau du Missouri in Hand County bear a resemblance to Great Oasis as well as IMM variant assemblages. Some of these sites are also associated with mound groups.

ONEOTA: The Ferguson site (39SB43) has been functionally interpreted as a bison kill and processing station. Ceramics from this site include grit, and grit and shell-tempered sherds. Haug (1979b) suggested the materials bear a resemblance to the Oneota assemblages collected from the Lower James River valley; however, the small ceramic assemblage sample size limits a definite interpretation of cultural affiliation. Some small metal fragments were also recovered in test excavations. It is not known if these materials are intrusive or if the site should be considered Protohistoric.

PREHISTORIC THEMATIC:

STONE CIRCLES. Stone circles are a common archaeological manifestation along the James River. Buechler and Keller (1983) and Haberman (1983c) report numerous stone circle sites. Some of these sites, such as 39SB46, are relatively large, with up to 25 stone circles.

BURIAL MOUNDS.

PROTOHISTORIC/CONTACT PERIOD: Few Protohistoric resources have been reported in the region. Of the known resources, early transportation routes or sites of local significance, such as John Brown's Mound near Forestburg, are commonly recorded.

HISTORIC EURO-AMERICAN: Historic resources generally consist of abandoned farmsteads (foundations), graves, or river fords.

MIDDLE JAMES DISCUSSION

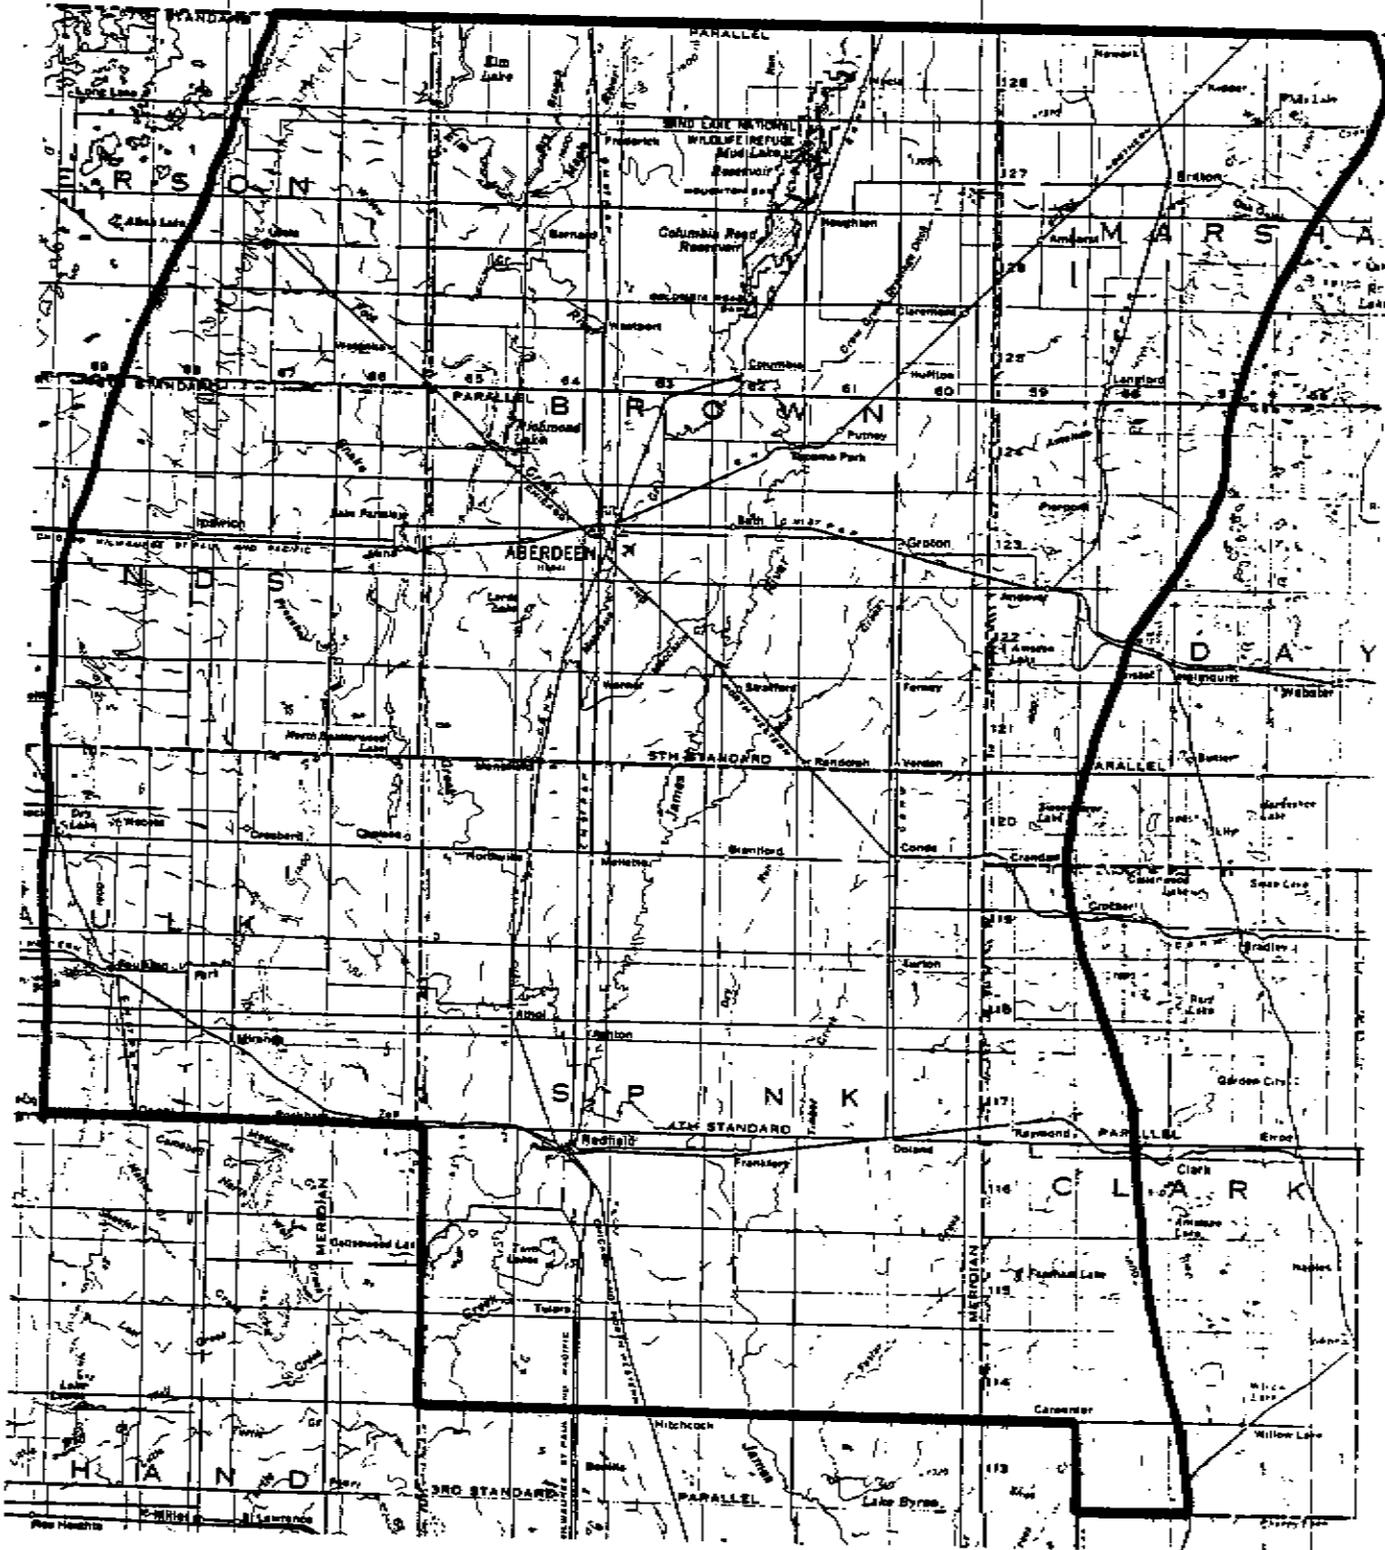

Basic data collection and inventory is needed to document early prehistoric remains, such as those from the Paleoindian and Early and Middle Plains Archaic periods. Do these materials exist, and if so, in what locational contexts? Survey results seem to indicate that early materials are likely to be deeply-buried. Additional research is also needed along the western margin of the Coteau du Missouri to identify and document prehistoric resources, especially near permanent springs.

The nature of Woodland occupation of the area needs clarifying. Woodland materials appear to be more common at the northern end of this region where they are not as deeply-buried as further south. What factors account for this?

Is there evidence of Oneota utilization of the region, and if so, what are the temporal parameters of such an occupation?

An examination of stone circle sites could be accomplished in this region since more stone circles appear to be present here than elsewhere in the James River Basin. There is also evidence for what is reported as a medicine wheel in southeastern Hand County (see Haug et al. 1983).

UPPER JAMES

UPPER JAMES

ARCHAEOLOGICAL REGION #18

SETTING

The Upper James Region encompasses the northern James River Basin in South Dakota. The area includes all or portions of Spink, Brown, McPherson, Edmunds, Faulk, Marshall, Day, and Clark counties. The topographic characteristics of the Upper James Region include a broad river valley and relatively flat to gently rolling hills. The river valley was once the bed of glacial Lake Dakota.

SUMMARY OF PREVIOUS ARCHAEOLOGICAL INVESTIGATIONS

The earliest archaeological investigations in the Upper James Region were conducted by T. H. Lewis in the late 1800s. Lewis (n.d.a) recorded a number of mounds and earthworks along the James River in Spink and Brown counties. The accuracy of Lewis's documentation is quite remarkable. W. H. Over (Sigstad and Sigstad, eds. 1973) of the USDM recorded sites along the James River within the region in the 1930s. Also, Howard and Black (n.d.) conducted a survey along the James River in Spink County for RBS. Following these early visits, little research was conducted in the area until the 1970s.

In 1974, Sigstad and Barjenbruch published the results of an examination of the prehistoric and historic resources of the James River valley in portions of Spink and Brown counties. In 1980 and 1982-1983, SARC continued a cultural resources inventory of the James River valley (Haberman 1983c; Keller and Keller 1982, 1984a) and also conducted test excavations at 39SP11 (Haberman 1980). Archaeological investigations along the route of the Northern Border Pipeline were also conducted in the area (Hannus et al. 1982). A sample survey of portions of the CENDAK irrigation project was conducted in the Upper James Region in 1982 (Haug et al. 1983). Since the late 1970s, a number of small-scale contract projects have been conducted in the region (Buechler 1985d, 1986a, 1987b, 1988e).

HISTORIC CONTEXTS

PALEOINDIAN:

PLANO. Three Plano complex sites have been recorded in the Upper James Region. The information concerning these sites was recovered from surface reconnaissance surveys (Hannus et al. 1982; Keller and Keller 1984a). An Agate Basin style projectile point base

fragment, lithic tools, and debitage were reported by Keller and Keller (1984a) in Brown County. Hannus et al. (1982) reported two Paleoindian sites, one in Spink County and one in Brown County. There are undocumented reports of additional Plano complex materials from the region.

EARLY ARCHAIC:

HAWKEN. Hannus et al. (1982) reported a Hawken-like projectile point recovered during investigations along the Northern Border Pipeline route in Edmunds County.

MIDDLE ARCHAIC: Keller and Keller (1984a) and Hannus et al. (1982) have reported Archaic materials in the northern portions of the region.

MCKEAN/DUNCAN/HANNA.

LATE ARCHAIC:

PELICAN LAKE. Late Archaic materials assigned to Pelican Lake have been reported in the region by Haberman (1983c); Hannus et al. (1982); and Keller and Keller (1982, 1984a).

LATE PREHISTORIC: Hannus et al. (1982) obtained a Late Prehistoric period radiocarbon date from a feature associated with stone circles.

AVONLEA. Keller and Keller (1984a) assigned one site to the Avonlea phase of the Late Prehistoric period.

WOODLAND:

BESANT. Besant-like materials have been recorded along the James River (Hannus et al. 1982; Keller and Keller 1984a).

LATE WOODLAND. Late Woodland materials are commonly found in the Upper James Region (e.g., Haberman 1983c; Hannus et al. 1982; Haug et al. 1983; Keller and Keller 1982, 1984a). Mound groups found along the James River valley are generally assigned to the Woodland period; however, few of these sites have been excavated. Excavations at 39SP11 (Haberman 1980) revealed a Woodland component at the site. This component has been dated to A.D. 540. Another significant discovery was the definition of a Woodland structure at the site. Based on the number of surface-collected sites assigned to the Woodland period, it appears that Woodland habitation sites are not as deeply-buried on the Lake Dakota plains as elsewhere on the James River valley. Major concentrations of Woodland materials are found near the confluences of Turtle Creek in Spink County and the Elm River in Brown County.

GREAT OASIS: Great Oasis materials have been reported along the Elm River in Brown County (Keller and Keller 1984a).

PLAINS VILLAGE: Sites containing ceramics assigned to the Plains Village period have been reported along the James River by Keller and Keller (1982, 1984a). These materials appear to be similar to early Plains Village materials recovered from the eastern margin of the Coteau du Missouri (i.e., the Rose Hill site). Haberman (in press) is currently preparing an interpretive analysis of these sites.

PREHISTORIC THEMATIC:

BURIAL MOUNDS. Mound groups found along the James River valley are generally assigned to the Woodland period.

STONE CIRCLES. Hannus et al. (1982) have obtained a Late Prehistoric period radiocarbon date from a feature associated with stone circles.

PROTOHISTORIC/CONTACT PERIOD: A number of protohistoric resources have been reported in the Upper James Region (Haberman 1983c; Hannus et al. 1982; Haug et al. 1983; Keller and Keller 1982, 1984a). The area along the James River between Fisher Grove and Armadale Island is associated with the Dakota Rendezvous, Drifting Goose, and Dirt Lodge village. The Abigale Gardner Release site/Council Stone locality near Redfield is also a well-known resource in the area.

HISTORIC NATIVE AMERICAN TRIBES.

DAKOTA SIOUX:

RESERVATIONS. Sisseton Indian Reservation.

HISTORIC EURO-AMERICAN: Historic resources are not well-documented in the Upper James Region. The majority of these resources consist of Euro-American farmsteads.

EARLY COMMERCIAL EXPLOITATION AND MILITARY PRESENCE.

FUR TRADING POSTS: A number of early fur and trading posts (Rondeil Post, Campbell's Post, Oakwood Post, and Elm River Post) are present in the region.

UPPER JAMES DISCUSSION

This region requires basic inventory research, particularly for areas beyond the James valley. An examination of glacial Lake Dakota shorelines may encounter very early (Paleoindian) sites. An examination of Woodland habitation sites might focus on the shallowly-buried sites on the Lake Dakota Plain.

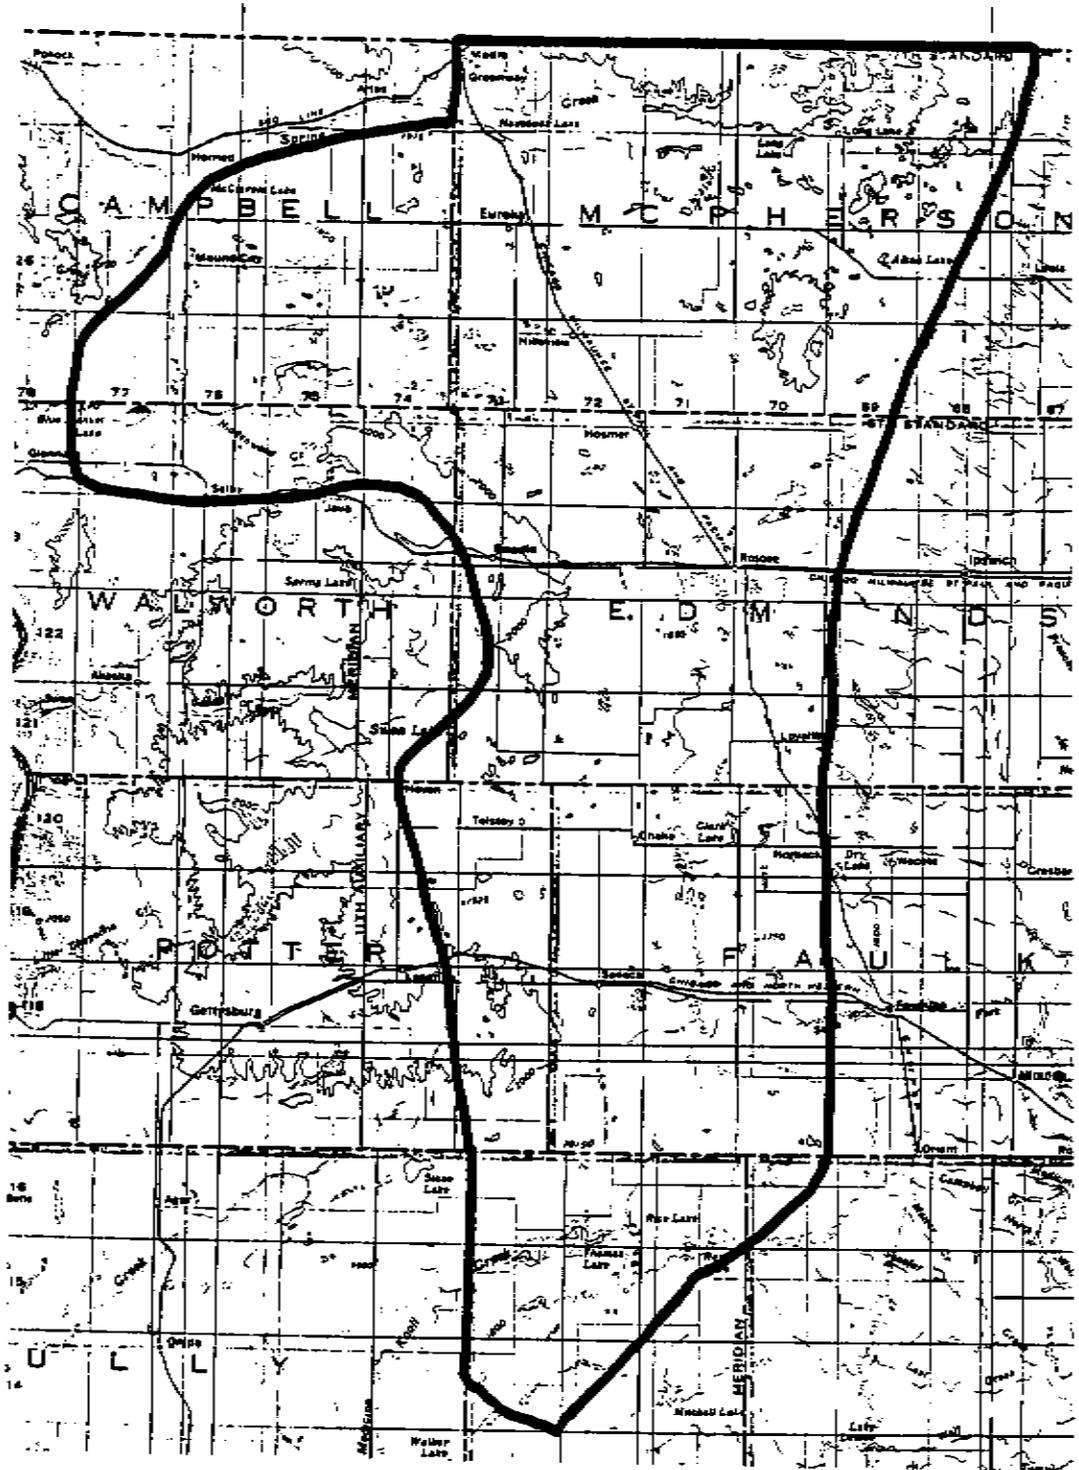

Paleoenvironmental studies may address such questions as whether the James River dried up during the Altithermal.

Specific regional topics include: Are the earthworks recorded by Lewis related to Woodland populations? A clarification of the confusion between the Armadale Island site (39SP101) and Dirt Lodge

village (39SP11) is needed. Was the Dakota Rendezvous always held somewhere between Fisher Grove and Armadale Island? Are there any sites that can be associated with the rendezvous?

The region has the potential to address problems of Dakota culture history and early fur trade outposts in South Dakota.

MISSOURI COTEAU

MISSOURI COTEAU

ARCHAEOLOGICAL REGION #19

SETTING

The Missouri Coteau Region is composed of rolling, grass-covered plains in north central South Dakota. Physiographically, this area is part of the Coteau du Missouri, an unevenly dissected plateau-like highland composed of a series of locally named hills such as the Ree Hills, Orient Hills, Bowdle Hills, Lebanon Hills, Lowry Hills, and Artas Hills. The drainage pattern of the Missouri Coteau area is largely interior with runoff collecting in local depressions (pothole sloughs) in the glacial drift (Flint 1955). Portions of Campbell, Walworth, Potter, McPherson, Edmunds, Faulk, and Hyde counties are included in this region.

SUMMARY OF PREVIOUS ARCHAEOLOGICAL INVESTIGATIONS

Little professional research had been undertaken within the Missouri Coteau Region until recent large-scale contract surveys examined portions of the area (Hannus et al. 1982; Haug et al. 1983). Chevance (1984) has compiled an overview of the cultural resources of the area. Small-scale survey projects have also been conducted in the area since the late 1970s (Buechler 1985b).

HISTORIC CONTEXTS

Very little is known about the archaeological resources of this region. Available information suggests stone circle and/or lithic scatter sites are common, especially near pothole sloughs. The results of the sample survey reported by Haug et al. (1983) suggest the margins of the Coteau du Missouri, especially along sheltered draws, springs, or south-facing exposures, should be considered to have a high probability of site occurrence.

MIDDLE ARCHAIC:

MCKEAN/DUNCAN/HANNA. McKean phase materials have been reported by Hannus et al. (1982) and observed in private collections from Edmunds County.

WOODLAND: Test excavations conducted at the Kuhl-Poindexter site (39FK12) revealed a multicomponent occupation by Middle Woodland, Late Woodland, and PCC populations (Haug et al. 1983). This site is located on an oxbow meander of Snake Creek in western Faulk County. Local residents have described what are thought to be cache

pits containing charred corn cobs eroding from the creek bank. Cultural deposits were encountered to a depth of nearly 2 m (Haug et al. 1983).

MIDDLE WOODLAND. Kuhl-Poindexter site.

LATE WOODLAND. Kuhl-Poindexter site.

PLAINS VILLAGE:

POST-CONTACT COALESCENT. Kuhl-Poindexter site.

PREHISTORIC THEMATIC:

STONE CIRCLES. Available information suggests stone circles are common near pothole sloughs. One extensive stone circle site along Spring Creek in McPherson County has been documented through aerial reconnaissance to cover seven sections of land.

PROTOHISTORIC/CONTACT PERIOD:

HISTORIC NATIVE AMERICAN TRIBES.

ARIKARA:

YANKTON SIOUX:

DAKOTA SIOUX:

HISTORIC EURO-AMERICAN:

PERMANENT RURAL AND URBAN PIONEER SETTLEMENT.

CLAIM STRUCTURES/HOMESTEADS: The region has extant sod structures relating to homestead development of the area.

MISSOURI COTEAU DISCUSSION

1. Identification and documentation of early archaeological remains should be examined in this region. Does McKean phase occupation of the area represent a prairie adaptation by a plains population?
2. What is the nature of Woodland occupations in the area? An examination of the relationship between Woodland and Late Archaic populations could be addressed in the region.
3. The PCC component at the Kuhl-Poindexter site requires additional research to determine taxonomic phase, site function, and seasonal or permanent occupancy. Is the site related to the Biesterfeldt site in any way? Does the site function as part of an Arikara trade network?
4. Potential Yankton-Yanktonai utilization of the area needs to be examined. Can Dakota Sioux sites be identified archaeologically?
5. The region has considerable research potential for the investigation of stone circle sites.

6. Historic resources need to be documented.
7. A multidisciplinary program directed at understanding prairie/coteau ecosystems could potentially be developed at Ordway Prairie.
8. Basic inventory and data collection should remain a high priority in the region.

PRAIRIE COTEAU

ARCHAEOLOGICAL REGION #20

SETTING

The Prairie Coteau Region encompasses portions of Marshall, Roberts, Day, Clark, Codington, Hamlin, Kingsbury, Brookings, and Lake counties in eastern South Dakota. The region is situated within the northern Coteau des Prairies, a glacial erosional remnant, irregularly covered with a thick mantle of glacial drift (Flint 1955). The Coteau des Prairies are a massive highland separating the James River Basin from the Red River and Big Sioux River drainages. The eastern slope of the coteau (especially in the north) is a striking escarpment rising nearly 800 feet above the Minnesota River valley. The southern margin of the east slope becomes progressively lower and less distinct. The western margin (overlooking the James River Basin) is less conspicuous than the eastern slope because the top of the coteau slopes to the west and the lowland to the west is at a higher altitude than the lowland east of it. The topography of the Coteau des Prairies exhibits a rough linearity in directions nearly parallel with the margins of the highlands. This is due to the presence of several end moraines which lie along both margins (Flint 1955). The surface of the coteau is dotted with numerous permanent and intermittent lakes and sloughs (prairie potholes).

SUMMARY OF PREVIOUS ARCHAEOLOGICAL INVESTIGATIONS

Comfort (1978) published the earliest reports of archaeological excavations in or near the Prairie Coteau Region. Comfort was an army surgeon stationed at Ft. Wadsworth (Sisseton) who excavated and described a number of burial mounds in northeastern South Dakota. T. H. Lewis (n.d.b) and W. H. Over (Sigstad and Sigstad, eds. 1973) each conducted early research in the region. Following this early work, little research was undertaken in the region until the 1970s, at which time small-scale survey projects were begun (e.g., Winham 1983a). Reports published by Hannus et al. (1982), Lass (1980), and Rood and Rood (1984) represent major research efforts in the region. Recent work has included the emergency salvage of materials from a mound near Punished Woman's Lake (Chevance 1988).

HISTORIC CONTEXTS

MIDDLE ARCHAIC:

MCKEAN/DUNCAN/HANNA. McNerney (1970) provides a descriptive analysis of chipped stone materials collected from the Blue Dog Lake vicinity. Some of these materials are assigned to the McKean phase of the Middle Plains Archaic period. Hannus et al. (1982) report Archaic age materials recovered during the Northern Border Pipeline survey.

WOODLAND: Woodland materials, especially burial mound groups, are commonly reported in the region (e.g., Comfort 1978; Keller and Zimmerman 1981; Lass 1980; Lewis n.d.b; McNerney 1970; Rood and Rood 1984; Sigstad and Sigstad 1973). A Woodland habitation site has been reported at Waubay Lake (Keller and Zimmerman 1981). The Woodland materials appear to have close affinities with materials from Minnesota and the northeast periphery.

GREAT OASIS: Great Oasis sites are quite common in the region (Alex 1981b). Site 39RO42, located along the eastern margin of the coteau, appears to be a fortified village that may be related to Great Oasis occupation of the area. This observation, however, is based only on a small sample of poorly-preserved bodysherds. According to Jim Haug, the site might be affiliated with some of the early Plains Village assemblages further east.

PLAINS VILLAGE:

MILL CREEK VARIANT. Cambria-like ceramic assemblages are found in many multiple component sites around the lakes.

PREHISTORIC THEMATIC:

STONE CIRCLES. Rood and Rood (1984) report a relatively high number of stone circle sites located on the eastern margin of the coteau.

EAGLE TRAPPING PITS. There are reports of an eagle trapping/vision quest pit located near Crocker.

BISON IMPOUNDMENTS. Possible bison impoundments are reported in Clark County.

PROTOHISTORIC/CONTACT PERIOD: Protohistoric and historic resources have been recorded by Lass (1980) and by Rood and Rood (1984).

RESERVATIONS. Sisseton Indian Reservation.

CHRISTIAN MISSIONS.

**HISTORIC EURO-AMERICAN:
EARLY COMMERCIAL EXPLORATION AND MILITARY PRESENCE.
FUR TRADING POSTS:**

PRAIRIE COTEAU DISCUSSION

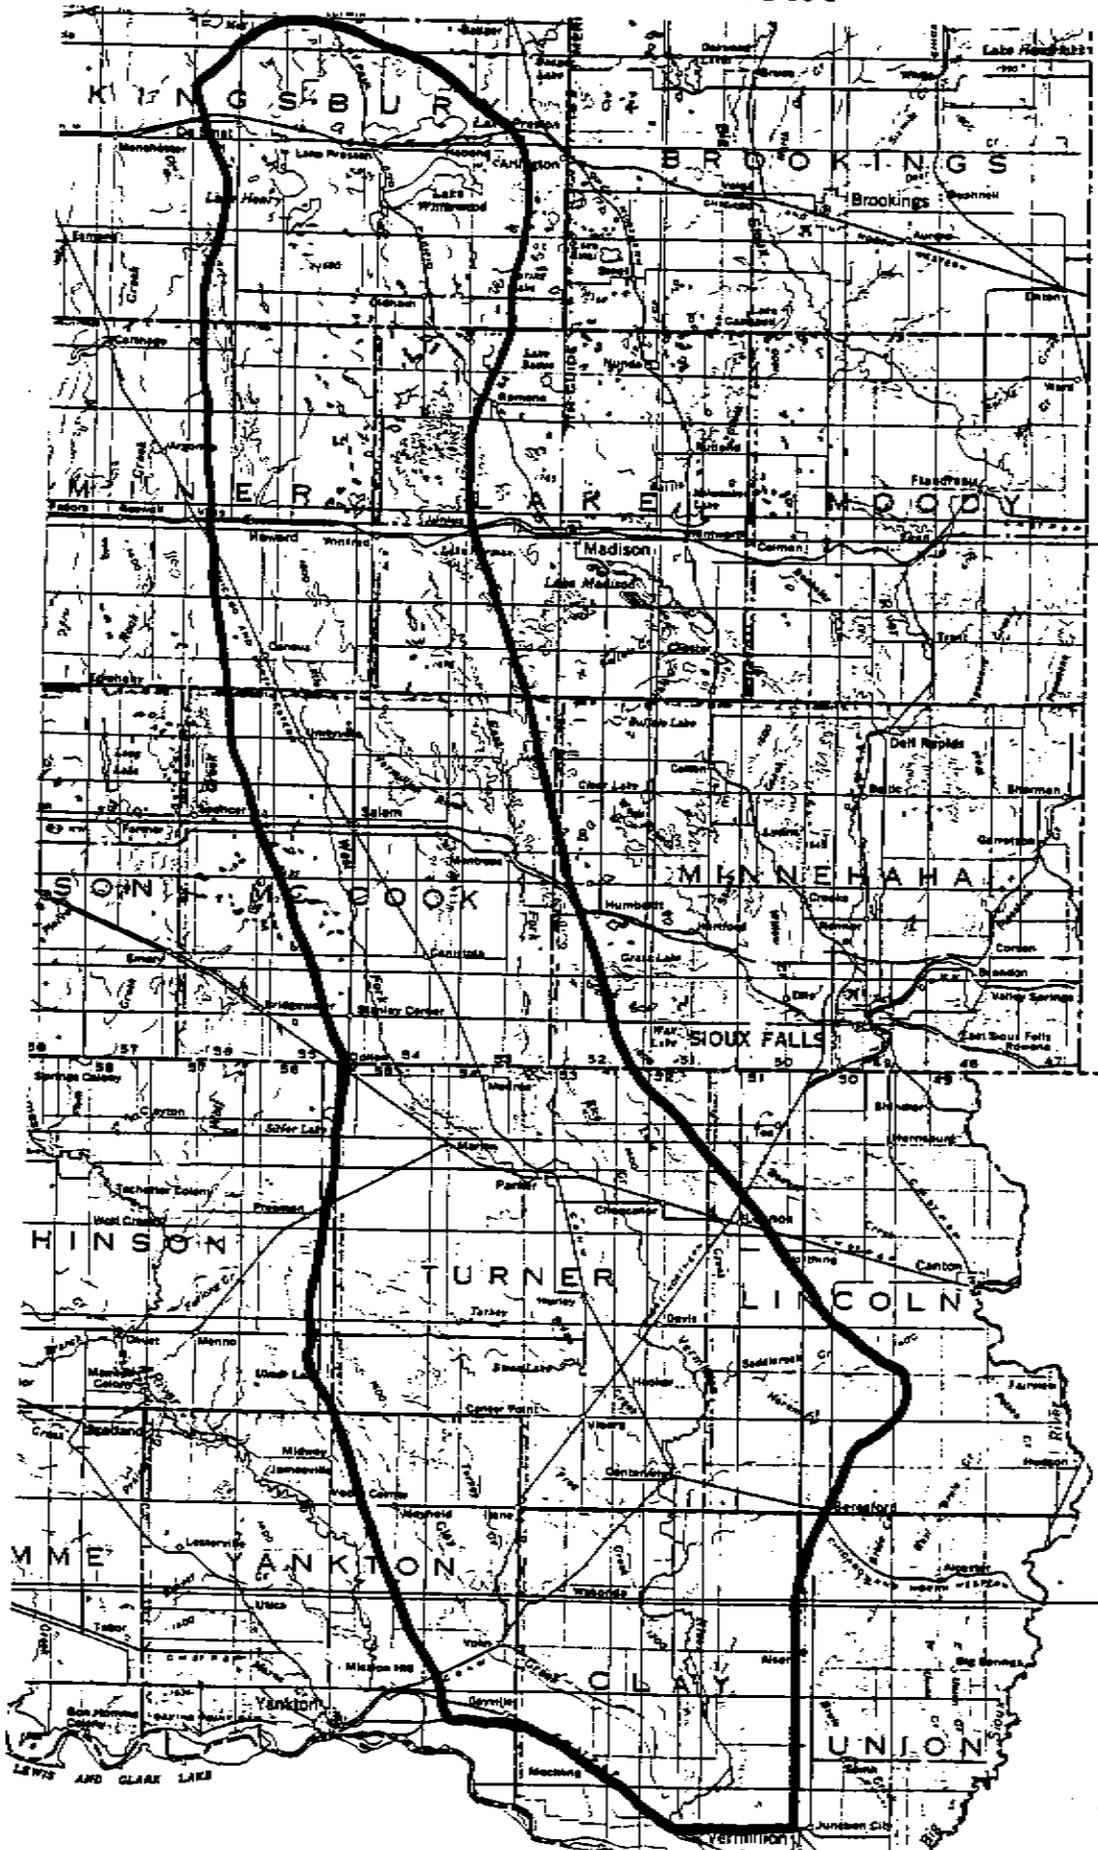

Basic data collection is a high priority, particularly the identification and documentation of preceramic cultural sites and contexts.

A valuable resource available for this region is a Paleo-environmental analysis of lake sediment core samples taken from Pickerel Lake (Watts and Bright 1968).

The region has the potential to address Woodland, Great Oasis and Cambria contexts. The Prairie Coteau Region could greatly enhance the development of a Great Oasis ceramic comparative collection.

Basic documentation of protohistoric and historic resources in the region is needed, for instance in regard to the Buffalo Lake Post, Brown's Trading Post, the Roy settlements at Roy Lake and Seiche Hollow, the Long Expedition of 1823, the Nicollet Expedition, ethnohistoric Dakota Sioux sites, and Indian/missionary relations.

VERMILION BASIN

VERMILLION BASIN

ARCHAEOLOGICAL REGION #21

SETTING

The Vermillion Basin Region includes the Vermillion River drainage system in portions of Kingsbury, Miner, Lake, McCook, Minnehaha, Turner, Lincoln, Yankton, Clay, and Union counties. The topography of the area is comprised of the Vermillion River valley, terraces, bluffs, and adjacent plains.

SUMMARY OF PREVIOUS ARCHAEOLOGICAL INVESTIGATIONS

No large-scale archaeological research projects have been conducted in the Vermillion Basin Region, and only a few small-scale projects have been undertaken (Lueck, Winham and Hannus 1987c; Winham, Lueck and Hannus 1985).

HISTORIC CONTEXTS

PLAINS VILLAGE: There are unconfirmed reports of an earthlodge village located somewhere on the Vermillion River north of Vermillion.

PREHISTORIC THEMATIC:

STONE CIRCLES. Several stone circles have been recorded in Turner County (Buechler 1977a).

PETROFORMS/EFFIGIES. A stone mosaic "thunderbird" effigy has been recorded in Turner County (Buechler 1977a).

SACRED SITES. Spirit Mound, a natural knoll located north of Vermillion, is mentioned in the journals of Lewis and Clark.

PROTOHISTORIC/CONTACT PERIOD:

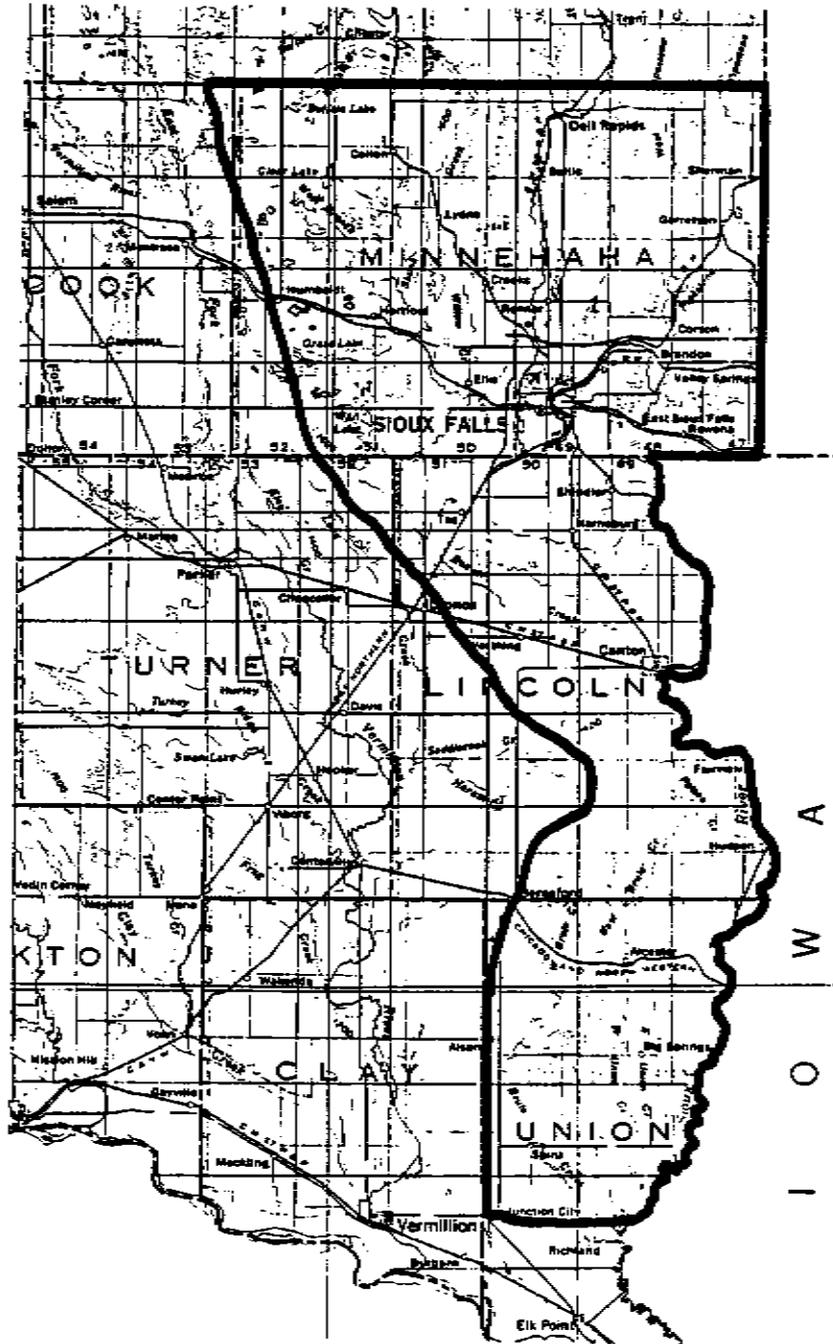

HISTORIC NATIVE AMERICAN TRIBES.

DAKOTA SIOUX: Historic Dakota Sioux skeletal materials and grave goods were recovered from a mound near Centerville (Kelly 1967).

VERMILLION BASIN DISCUSSION

The most pressing research goal for the region calls for basic data collection/inventory. Due to the frequent flooding of the river valley, especially the lower reaches, early sites are likely to be deeply-buried.

LOWER BIG SIOUX

LOWER BIG SIOUX

ARCHAEOLOGICAL REGION #22

SETTING

The Lower Big Sioux Region encompasses the lower reaches of the Big Sioux River drainage basin in southeastern South Dakota. The region includes portions of Union, Lincoln, Turner, McCook and Minnehaha counties. The general topography of the area consists of the Big Sioux River valley, bluffs, and adjacent plains. Areas such as Newton Hills in Lincoln County offer local relief. The bedrock of the area is largely Pre-Cambrian age Sioux quartzite.

SUMMARY OF PREVIOUS ARCHAEOLOGICAL INVESTIGATIONS

Early references to mound and village sites in the Lower Big Sioux Region were made by Barrandt (1873), Lewis (n.d.c), and Over (Sigstad and Sigstad, eds. 1973). Excavations at the Brandon Village site and Split Rock Creek Mounds were conducted by Over in 1939-1940 (Over and Meleen 1941). The Brandon Village has been assigned to the IMM variant of the Plains Village period, while there is still some question regarding the cultural affiliation of the Split Rock Creek mounds. Additional excavations have been conducted by Gant and Brandon (1963), Hannus (1974), Hurt (1963), and Zimmerman (1975). Recent excavations have been conducted at a number of sites but the results have not yet been published.

Sigstad (1973b) has reported on a survey of the west bank of the Big Sioux River. A number of small-scale survey reports have also been prepared describing research conducted within the region (Hannus, Lueck and Winham 1987; Winham et al. 1983) and a series of ongoing research projects are being undertaken by ALAC (Hannus, Winham and Lueck 1986; Lueck, Hannus and Winham 1988; Lueck, Winham and Hannus 1987a, 1987b; Lueck et al. 1988; Winham and Lueck 1989; Winham, Lueck and Hannus 1985). Several projects have been associated with the proposed alterations to Highway 11 (Haberman 1986b, 1988).

HISTORIC CONTEXTS

Pre-ceramic cultural materials have not been identified from the region; however, there are unconfirmed reports of deeply-buried cultural strata eroding from the Big Sioux River cutbanks. The context of these strata suggest they may contain pre-ceramic materials.

WOODLAND: Woodland sites, especially mound groups, are a common archaeological feature of the region (e.g., Barrandt 1873; Gant and Brandon 1963; Hurt 1963; Lewis n.d.c; Over and Meleen 1941; Sigstad 1973b). The majority of the Woodland resources of the region have been recorded in Minnehaha County, especially in the Split Rock Creek and Beaver Creek vicinity. Little is understood regarding the cultural dynamics of Woodland populations in the area. Materials associated with the Sherman Park Mounds (Gant and Brandon 1963; Hurt 1963) suggest Middle Woodland, Great Oasis, and Dakota Sioux interments.

MIDDLE WOODLAND. Sherman Park Mounds.

GREAT OASIS: See Sherman Park Mounds. In 1976, Hannus and Zimmerman co-directed excavation efforts at the Heath site, a Great Oasis earthlodge. The site is radiocarbon dated at 940±140 years B.P.

PLAINS VILLAGE: Since the excavations at the Brandon Village in 1941, a number of test excavations have been conducted at Plains Village period sites; however, few of these projects have been published. Zimmerman (1975) conducted test excavations at the Emineja site and tentatively identified it as Plains Village.

MILL CREEK VARIANT: Mill Creek materials are ascribed to the region by Ludwickson et al. (1981). This identification is based on work conducted by Over (Sigstad and Sigstad, eds. 1973) at burial mounds in Union County. Additional research is necessary to confirm the presence of Mill Creek populations in the region.

INITIAL MIDDLE MISSOURI. Major excavations were conducted at the Brandon site in 1939-1940 (Over and Meleen 1941). There are numerous reports of IMM materials encountered during construction within the City of Sioux Falls; however, it is not known whether this site density is a factor of urban development or aboriginal site preference. It is also not known if the ceramic traits from these sites are similar to those from the Brandon site.

ONEOTA: Oneota materials are present in the region at the Rock Island site. The Rock Island site is undoubtedly related to the extensive Oneota site called Blood Run, located across the Big Sioux River in Iowa.

PREHISTORIC THEMATIC:
BURIAL MOUNDS.

PROTOHISTORIC/CONTACT PERIOD:
HISTORIC NATIVE AMERICAN TRIBES.
DAKOTA SIOUX: Sherman Park Mounds.

HISTORIC EURO-AMERICAN:

EARLY COMMERCIAL EXPLORATION AND MILITARY PRESENCE.

FORTS (A.D. 1856-1946): Fort Sod (Dakota) located in
Sioux Falls.

PERMANENT RURAL AND URBAN PIONEER SETTLEMENT.

MINING: Sioux Quartzite. Catlinite quarries are
located in the Garretson vicinity.

OTHER EURO-AMERICAN.

ETHNIC ENCLAVES: Scandinavian.

URBAN DEVELOPMENT

COMMERCIAL DEVELOPMENT

RESIDENTIAL

INDUSTRIAL STRUCTURES

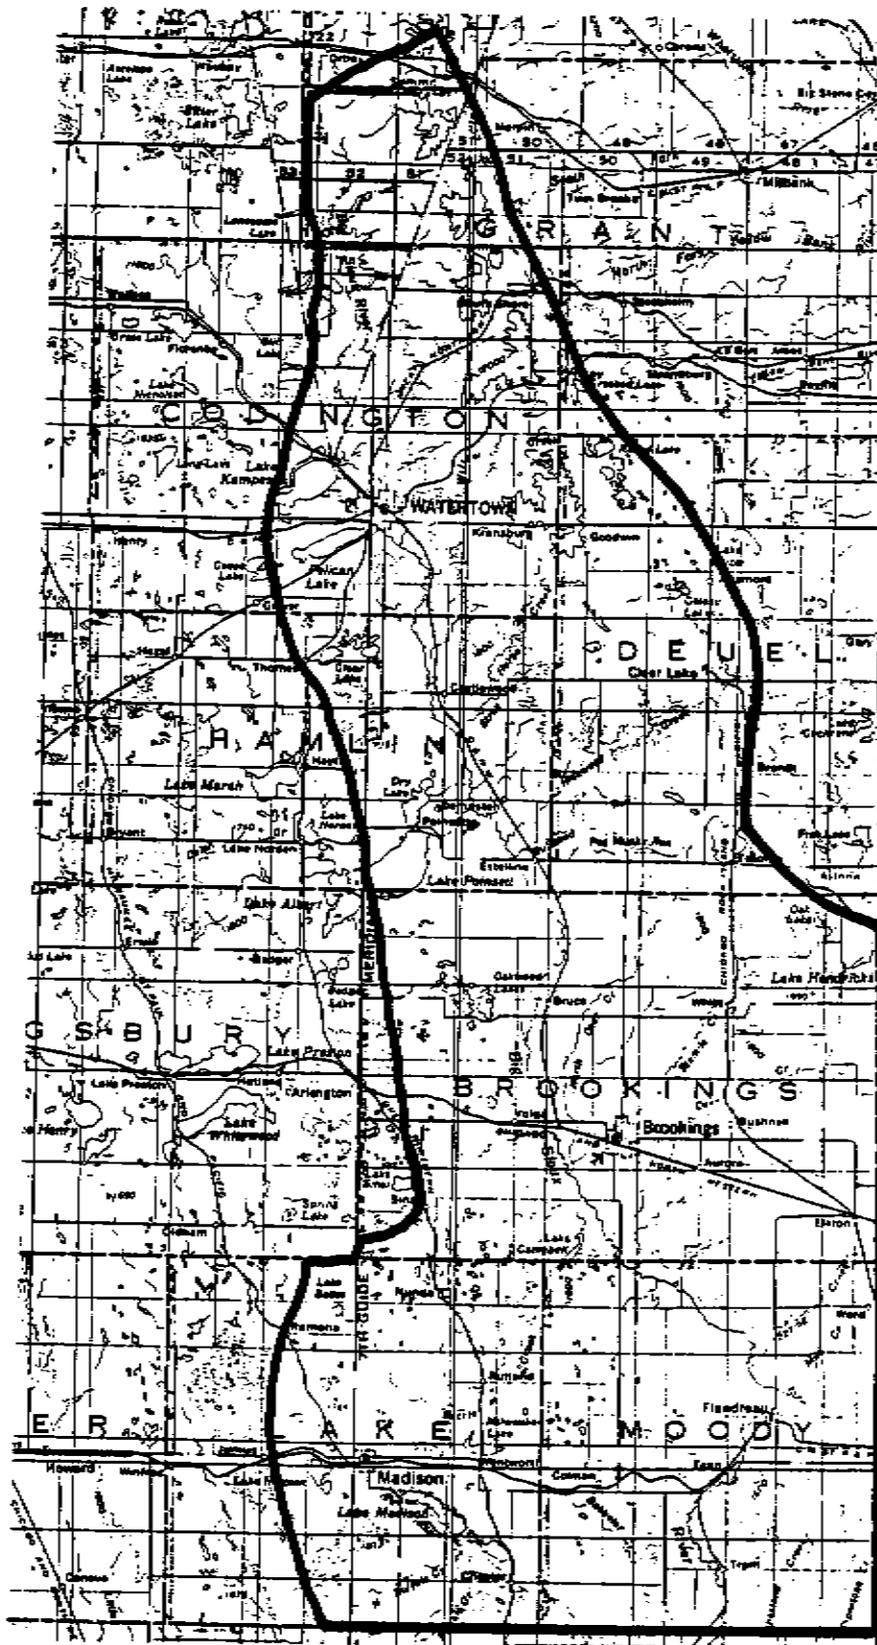

LOWER BIG SIOUX DISCUSSION

Basic inventory/data collection is still a priority. The protohistoric and historic resources in particular are poorly-documented in the region. Part of this inventory will need to include the identification and documentation of deeply-buried sites. This research could easily include geomorphological investigations to develop predictive statements regarding the contextual location of these components.

The region has good potential for examining Woodland and IMM contexts. A synthesis of the IMM resources of the Sioux Falls vicinity could be undertaken.

The region is well-suited to address early settlement of South Dakota before the Great Sioux Uprising, early industrial development, stone quarry (Sioux quartzite) techniques and ethnic Scandinavian settlement of the region.

UPPER BIG SIOUX

UPPER BIG SIOUX

ARCHAEOLOGICAL REGION #23

SETTING

The Upper Big Sioux Region encompasses the upper reaches of the Big Sioux River drainage basin in portions of Roberts, Grant, Codington, Deuel, Hamlin, Brookings, Moody, and Lake counties. The general topography of the region is comprised of the Big Sioux River valley, bluffs and adjacent plains. Numerous permanent and intermittent lakes are also found in the region.

SUMMARY OF PREVIOUS ARCHAEOLOGICAL INVESTIGATIONS

Lewis (n.d.c) and Over (Sigstad and Sigstad, eds. 1973) conducted the earliest archaeological investigations in the Upper Big Sioux Region. Following these early investigations, little research was conducted in the region until the 1970s. Portions of the Big Sioux River were examined by Sigstad (1973b) in 1970. In 1979, Haug (1979c) conducted test excavations at the Garden site; Ruple (1982) surveyed portions of Oakwood Lakes State Park; Hannus conducted excavations at 39BK7; and Alex (1980b) tested 39BK8. In 1980, Lass (1980) conducted a sample survey of portions of the region; Haug (1982b) undertook excavations at the Winter site; and Buechler supervised test excavations at 39BK8 (Cheever 1980; Buechler 1982b). The Northern Border Pipeline survey also examined portions of the region (Hannus et al. 1982). In addition to these efforts, a number of small-scale contract and research surveys have been conducted within the region (Hannus, Winham and Lueck 1986; Lueck, Winham and Hannus 1987c).

HISTORIC CONTEXTS

PALEOINDIAN:

FOLSOM. Haug (1982b) suggests there may be an intact Folsom complex component at the Winter site.

PLANO. Alberta points have been reported by Haug and Sterner (1978).

MIDDLE ARCHAIC: Dates from the Hilde site (39LK7), located near Lake Madison in Lake County, suggest a Middle Archaic affiliation. A corrected date of 2545-1965 B.C. was obtained from bone and a date of 2895-2320 B.C. was obtained on charcoal from a hearth-like feature. Numerous interments were encountered at the site but its original designation as a "mound" is likely incorrect.

MCKEAN/DUNCAN/HANNA. McKean phase materials have been reported by Haug (1982b); Haug and Sterner (1978); and Lass (1980).

WOODLAND: Woodland materials are quite common in the Upper Big Sioux Region (e.g., Hannus 1981; Hannus et al. 1982; Haug 1979c, 1982b; Lass 1980; Ruple 1982; Sigstad 1973b). Major excavations at site 39BK7 in the Oakwood Lakes State Park vicinity indicated multiple components consisting of Sonota complex(?), Middle Woodland, Late Woodland, and later component materials (Hannus 1981). Cultural deposits at the Winter site also indicated Middle and Late Woodland components. Burial mounds are a common form of Woodland site in the region. Howard (1968) has reported on investigations at Spawn Mound in Lake County.

SONOTA COMPLEX. Connection with Oakwood Lakes.

MIDDLE WOODLAND.

LATE WOODLAND.

GREAT OASIS: Great Oasis materials are fairly common in the Upper Big Sioux Region. Test excavations conducted at the Volunteer site (Alex 1980b; Buechler 1982b; Cheever 1980) suggest the site is a single occupation of Great Oasis peoples. Alex (1980b) proposes the subsistence economy was based on a very generalized strategy of small mammal exploitation; some charred corn is present in soil samples. Haug (1982b) also reports a Great Oasis component at the Winter site. Additionally, there are unconfirmed reports of Great Oasis materials from the Lake Poinsett vicinity.

PLAINS VILLAGE: Lewis (n.d.c) has recorded earthworks suggesting the presence of a fortification ditch in Brookings County.

MILL CREEK VARIANT: Haug (1979c, 1982b) reports broad-trailed ceramic materials that resemble Cambria-like materials. It is not known if Cambria populations utilized the region or if the materials are a local trait.

ONEOTA: Shell-tempered ceramics from the late component at 39BK7 are similar to Oneota materials. It is not known if the component represents extensive Oneota utilization of the prairie lakes region. This type of exploitation appears to conform to Oneota subsistence economies in other areas of the Plains; however, more data is needed to define this cultural component.

PREHISTORIC THEMATIC:

BURIAL MOUNDS.

PROTOHISTORIC/CONTACT PERIOD: Some Protohistoric and Historic period resources have been reported by Lass (1980) and Ruple (1982); however, additional research is necessary to document the resources of the area.

RESERVATIONS. Sisseton Indian Reservation; Flandreau Agency and Reservation.

HISTORIC EURO-AMERICAN:

EARLY COMMERCIAL EXPLORATION AND MILITARY PRESENCE.

FUR TRADING POSTS: Chanopa Trade Post, the Two Woods Post near Twin Lakes.

OTHER EURO-AMERICAN.

CLAIM STRUCTURES: Spot Mortimer's cabin, Lake Herman cabins.

URBAN DEVELOPMENT: Lake Herman townsite, Medary townsite.

UPPER BIG SIOUX DISCUSSION

This region needs additional basic inventory/data collection, particularly to identify pre-ceramic sites and Woodland habitation sites. The region offers good potential to address questions relating to Woodland, Great Oasis and IMM contexts, as well as the opportunity to examine subsistence economies in the prairie lakes area.

A specific question is whether Cambria or Oneota is present in the region. Do these materials represent migration into the area or seasonal exploitation of prairie lakes resources?

NORTHEAST LOWLAND

ARCHAEOLOGICAL REGION #24

SETTING

The Northeast Lowland Region is situated in the extreme northeastern corner of South Dakota. The region encompasses portions of Marshall, Roberts, Grant, Deuel, and Brookings counties. Topographically, the area consists of a broad, flat plain. With few exceptions, the surface relief of the plain is less than 20 feet (Flint 1955). The northern portion of the region drains northward into the Red River while the southern portion drains southeastward to the Minnesota River.

SUMMARY OF PREVIOUS ARCHAEOLOGICAL INVESTIGATIONS

Lewis (n.d.c) and Over (Sigstad and Sigstad, eds. 1973) conducted the bulk of the early research in the area. Over focused a great deal of effort in the region, recording and excavating a number of important archaeological sites. Haug (1982b) revisited many of the sites Over recorded and conducted test excavations at the Hartford Beach village in 1980-1981. Lass (1980) has surveyed portions of the region. Beyond these research efforts, little has been done in the region other than small-scale contract survey projects. Johnson (1973) discusses some of the sites in the area as being part of a Woodland burial complex known as the Arvilla complex. Rood and Rood (1984) conducted a survey of the western margin of the Coteau des Prairies, immediately west of the Northeast Lowland Region.

HISTORIC CONTEXTS

PALEOINDIAN: Paleoindian sites have been identified within the region by Lass (1980).

PLANO. Site 39DE9 produced an Alberta point (Lass 1980).

ARCHAIC: Archaic sites have been identified within the region by Lass (1980).

WOODLAND: Woodland burial mounds are common and a number were excavated by Over (Sigstad and Sigstad, eds. 1973). Sigstad and Sigstad (1973) conducted salvage excavations of a Woodland mound in cooperation with the Sisseton-Wahpeton Sioux tribe in 1972. However, no Woodland habitation sites have been examined.

ARVILLA.

PLAINS VILLAGE: Plains Village materials are present at the Hartford Beach Village as well as at a number of poorly-documented sites. Haug (1982b) reports the Hartford Beach Village materials are characterized by broad-trailed scroll decoration. The site is also fortified. Radiocarbon dates range from A.D. 1100-1300 (Haug 1983c). Lewis (n.d.c) reports several earthworks in the region which may represent fortified villages.

ONEOTA: A few sites containing Oneota-like materials are reported in the region.

**PREHISTORIC THEMATIC:
BURIAL MOUNDS.**

PROTOHISTORIC/CONTACT PERIOD: Protohistoric and historic resources are poorly-documented.

HISTORIC NATIVE AMERICAN TRIBES.

TETON SIOUX: It is known that the Big Stone Lake area was at one time occupied by the Teton Sioux (Wedel 1974).

HISTORIC EURO-AMERICAN:

EARLY COMMERCIAL EXPLORATION AND MILITARY PRESENCE.

The Stephen Long Expedition of 1823, as well as the Nicollet Expedition are known to have travelled through the region.

NORTHEAST LOWLAND DISCUSSION

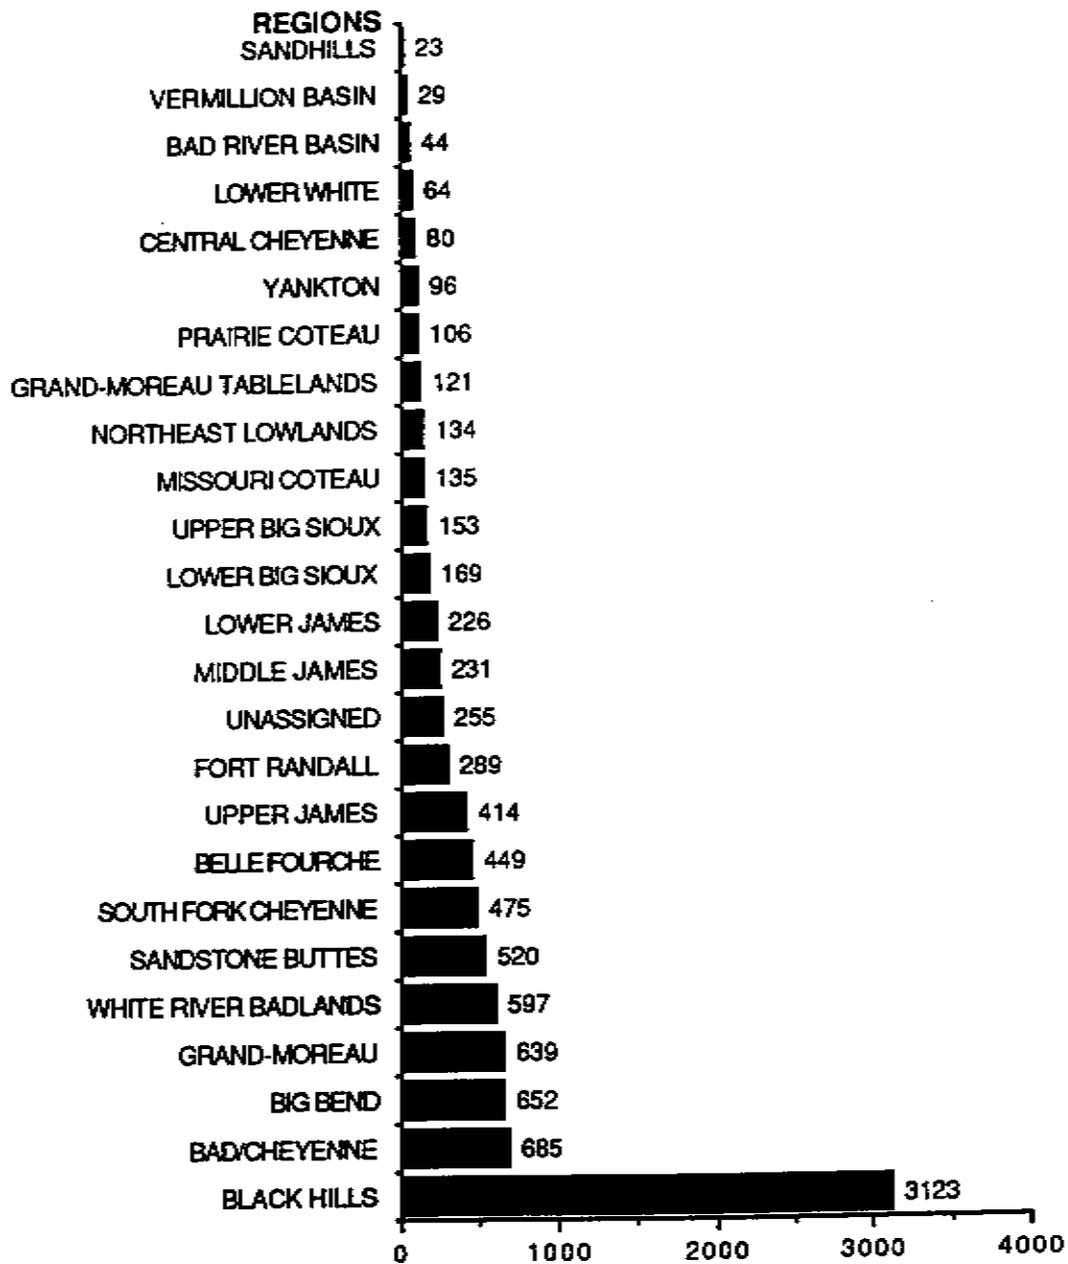

Basic inventory and data collection is required for the region, especially along the lakes and ancillary drainages. The nature of Woodland and Oneota occupation in the region needs better definition. Further studies of the poorly-understood complex represented at Hartford Beach Village and similar sites could provide much-needed data regarding Woodland-Plains Village transitions and interrelations.

Documentation of the protohistoric and historic resources of the region is limited. Can early Teton Sioux sites be identified archaeologically? This region has the potential to indicate what western Dakota populations were like in the late seventeenth century. What are the temporal parameters of Lakota occupation of the region? Questions concerning adaptation and cultural change to early reservation life can be addressed in the region.

LIST OF ARCHAEOLOGICAL REGIONS SHOWING THE NUMBER OF SITES

1982

Stone Circle Sites. In Cultural Resource Investigations of the South Dakota Segment of the Northern Border Pipeline, by L. Adrien Hannus, Judith Apley, Philip R. Bjork, Kenneth L. Brown, Marie E. Brown, John Butterbrodt, Thomas Haberman, Renee Keller, Steve Keller, Edward J. Lueck, David B. Miller, Timothy R. Nowak, Charles E. Orser, Jr., Ben Rhodd, Everett M. White, Katherine Winham and Peter Winham, vol. 4, pp. 23.1-23.74. Archeology Laboratory, South Dakota State University, Brookings. Submitted to Northern Plains Natural Gas Company, Omaha, NE.

Winham R. Peter, and Edward J. Lueck
n.d. Cultures of the Middle Missouri. In Cultures of the Great Plains, A.D. 500-1500, edited by Karl Schlesier (in prep).

APPENDICES

APPENDIX A

Suggestions for Completing "Archaeological Region Reports"

A number of steps should be standardized when completing regional reports for the State Planning Process.

- 1) The boundaries of the region must be delimited on USGS quadrangle maps. For purely practical purposes a site is either in a region or not in a region. If a site overlaps a regional boundary then it should be considered as being in both regions.
- 2) The SARC archives should be used to obtain a list of all sites within the defined region. Ideally, the master USGS quadrangle maps should be used to obtain the list of sites and to delimit the areas that have been previously surveyed.
- 3) A distribution map of all sites (and sites by context(s)) and all areas surveyed should be produced.
- 4) SARC should be given a set of USGS maps with the region boundaries clearly defined so they can check region names on existing and future site forms.
- 5) It should be clear as to what data (sites/surveys) were included in the regional synthesis, i.e., what the cut-off date was for data gathering. This will make it easier to complete subsequent updates to the regional synthesis.

APPENDIX B

Suggestions for Revising This Volume

This volume may or may not stand the test of time. Each section (contexts, regions, special information, references) is compiled separately so that each can be worked on and revised accordingly. Please annotate pages in the document as you think fit and send copies of your comments/changes/additions to the State Archaeological Research Center. The loose leaf format is designed to allow individual sections to be updated without the need to reprint the entire volume.
